Why must you insist on correcting every statment I make concerning
Apple. I do infact mean Apple Video Player. It is on my 840AV now
as I type this. If you don't know what is available, don't say it
dosen't exist. Now you can be sorry for that as well.
As for the MPEG codec, why include something that none of the
product line will be able to utilize because of the O/S overhead?
Even with custom codecs, MPEG on the Mac is extreamly slow.

Touchy here.. Everything I say is false? Care to back that up...The prices I
quoted are accurate unless you live in Canada..

I can dig up and post an Apple press release here.. Don't temp me.. Plus the
retailers and catalogs list the prices I posted..

Well, he was correct, you know. You can't really blame him for correcting
you when you are in fact wrong. And it was a much milder correction than
he could have chosen to make, given your confrontational manner.

> I do infact mean Apple Video Player. It is on my 840AV now
>as I type this.

Apple Video Player is an application which displays your 840AV's NTSC/PAL
video digitizer output in a window. It doesn't play QuickTime movies at
all; it doesn't even have an Open command in the File menu! You use it to
view analog video from a VCR or camera. (You should also have a program,
which I forget the name of since it's been a while since I had my 660AV,
which captures the digitized video into a QuickTime movie.)

MoviePlayer is the QuickTime player program supplied by Apple.

> If you don't know what is available, don't say it
>dosen't exist. Now you can be sorry for that as well.

Brian did not say that Apple Video Player does not exist. He said that you probably meant MoviePlayer instead, which apparently was giving you more credit for Mac knowledge than you deserved.

>As for the MPEG codec, why include something that none of the
>product line will be able to utilize because of the O/S overhead?
>Even with custom codecs, MPEG on the Mac is extreamly slow.

Define "extreamly [sp] slow". Do you expect your 840AV to decode fullscreen MPEGs even close to realtime? That's a laugh. It's only a 40 MHz 040. Haven't had much experience with MPEG on any platform, have you?

Think of MPEG playback as being like decoding a JPEG picture each frame, except that you must crunch together data from several past frames and perhaps even some future frames as well as expanding the current frame. There is a good reason why people who need to work with MPEG at all buy MPEG coprocessor boards.

(The only announced general purpose CPU capable of realtime MPEG *encoding* is the DEC Alpha 21264, the next-generation Alpha, which will debut at 500 MHz. Think about that.)

BTW, any Atari dealers in R/C? I never found one after Ridgecrest Computer Center shut down.

Nope..The 6400/200 is $2199 and or $2049 with printer rebate..

If thats to much power for ya, the $1499 6360/160 with 28k modem to boot..

Had the place that sells the controlers for $2.50 only sells in bulk for
other businesses to sell to customers, then that's ok.

But this is a retailer that sells to the public, meaning it was ment for
the public buyer. But if dealers will buy out stock from another dealer
and sell for a higher price, then what's the consumer to do? If the price
were barely higher then that wouldn't bother me, $5 would be fine. But
for a ridiculous price that's way out of line, forget it! Then it'll be
the same as ticket scalping.

BTW, I'm wondering if anyone with a ST computer still would buy a Jag
controler with a good reason. I had an idea for a driver to use Jag pads
in games that look for a joystick, but with the way the Atari scene
is...looks awful bleak :P

It's a outside scene.  It's on a store window in the background.  it shouws
up several times.
I think it is when he kills those guys outside in the rain.

I have a 6100/60 and when trying to connect it to a network, I had to
buy a
NuBus Adapter card.  I was shocked to find out that apple no longer
makes
the card. They have them, but they are $500.00 Which I think is INSANE.
The
Nubus card itself was only $250.00. Is there anyone who knows where I
can
get a NuBus Adapter card for a 6100/60.
For less than 500.00

So what is a Amiga user doing in this group talking about Apex Media? :-)
BTW. Apex Media will look like Degas Elite compared to Apex 3. I have seen it, I know! :

 You forgot to mention (what are you, senile?) that it still only comes
 with 1 meg of VRAM, and that to upgrade it you have to buy a PCI card,
 and it DOES NOT INCLUDE the monitor!

ROFL!!   Nice try..

The 6100 line comes with ethernet installed, you know a standard feature that is an extra/option on the overpriced TOS line..

I don't know where this person comes up with $500 for a Nubus card. Does this price include a ethernet as well. Still the most he would pay for a Nubus plus ethernet is $200. However, the Nubus adaptor can be had for $49 from Shrieve Systems and is on my price list...

If your not happy with the video, than you should get a PowerComputing
PowerBase 180 which comes with the new ATI video chip and 2MB vram for $1499!
My bro has one on order..

> I'm quoting directly from the latest issue of the Computer Shopper. AND it
> still does not include a monitor...does any of yours???

Why don't you quote from the inserts in your Sunday paper from the likes of
CompUSA and Best Buy...

The Computer Shopper recieves those adds months before publication and are
dated. Apple reduced the price in the third week of October..

> Thats a fair price for the performance that you would get from a machine
> with their specs. running TOS! BTW, why in the world would I want to step
> down to a Quadra????? (no matter what the price!)

ROFL again.. What denial! There is nothing efficient about TOS. If TOS has
the functionality and features, of course you could brag, but you can't..

Those prices are obscene...

>> according to the magazines I read and the people that I spoke to and I
>> wouldn't call that blowing the 601 away.
>
>Why not? Comparing PowerBook speed to desktop ones is like comparing apples
>and oranges..

If a desktop machine existed then I would have compared those machines
and I expect the 601 would be faster than the 603e when both are at similar
clock speeds, but as you say, apple have handicapped the 603e machines
so the comparisons are not fair.

>PowerBooks tend to have a slower archetecture than their desktop
>ones due to bus and video speed..
>
>A 160 mhz PPC 603e exceeds a 120 mhz 601..

Can you not see that when comparing chip power it is only sensible to
compare them at similar speeds?

For most, I meg is fine..However, you have choices.. Try the PowerComputing PowerBase 180 for $1499..Includes the new ATI 2/3d chip with 2meg VRAM..

Still cheaper than a 040 HAdes/Direct by at least a grand..

The TOS machines DO NOT INCLUDE A MONITOR!

Thanks for taking the time to read this message! This is about a lady that gave all she could to everyone, including me. Her name is Wendy.

When I was young she became my foster mother after my real mother had abandon me. Never having any kids of her own she became a foster parent. That I got to be in her care was probably the best thing that had ever happened to me. She had other foster children and even ended up taking care of many of the neighborhood kids.

Wendy is a lady that just never gave up and always gave more than anyone could imagine. I no longer think of my real mother as mother but rather Wendy as my only true mother. I know that I'm not the only one that thinks that way either. It wasn't just kids that she helped it included the elderly, the disabled and the just down and out. What it takes to qualify for a saint is something I never found out, but I know it can't be more than the things I saw this lady do for anybody. Even people that had wronged her could find themselves looking up at her while she helped them when they were down.

I'm 26 now and many of the things I'm telling you I never really realized until now. Since I was a kid she has helped me with everything from recovering from my mistakes to just being there to say "You can do it... It'll be okay." I've never been able to make a good attempt at trying to repay her for all she's done for me and I'm not alone. Many people just have taken for granted the things she's done for them.

I know by now you're asking yourself why I've posted this letter. Well, to be honest and straight with you it's because I would like your help. If there's one thing that I've learned from Wendy it's that, "We are our neighbors keepers." You know the golden rule, "Do onto others as you would have them do onto you." Anyway now Wendy is an older lady that is disabled and can't do as much as she used to. With the disability sometimes expenses can be too much. I now live in Arkansas and can't be of much help. With no real family I'd like to do something to try to repay all she done for me and many others.

That's were you come in. See if you can think back to someone that helped you no matter how big or small. Maybe it's someone you can't even remember or have lost touch with. For that moment picture Wendy and say, "I'd like to repay that kindness." I wish you would sit down and write a small note saying "Thanks for being the generous person that you have been!" If you could include something to help out. Maybe it's a five dollar bill, a book of stamps, even a dollar. Oh and would you also tell her the Steffin sends his love. Her birthday is next month on the 27th and I'm hoping I can make this own a very memorable one.

Thanks for reading and if you choose to help God pless you.
Her address is

Wendy Mcghee
9636 Elm
Taylor, Mi 48180

The Falcon has MIDI and DSP integrated into the design, it is not an add on. It is suited for this purpose right out of the box and many Gold records have been produced on Falcon technology.

This is not really the right newsgroup to ask this question. You are apt to get flames from users like Peter Sinclair-Day whose only goal in life is to entice people to entertain him with stupid feeble arguments.

The best place to find out about the power and functionality of this machine is in comp.sys.atari.st

All the best,

Chris @ Computer Direct

Simple, from where I learned of this (on the 'net) they did sell all over the country via catalog.

What we apparently have here is someone who is not just interested in taking a risk, for that they could have bought 100-200 or so. Instead, they bought up the whole stock. Doing so for the express purpose of shutting everyone else out so they can demand their own price.

It would have been pointless to purchase a couple of hundred if others were still being sold at $2.50.

>up the whole stock. Doing so for the express purpose of shutting everyone
>else out so they can demand their own price.

If this were food, then clearly there would be a problem. But it is only a game controller. Here's to the free market economy and the American way of life.

Yes, its true, while there's nothing really wrong with buying up the stock,
it does irritate me. Ah well, I just know they will turn up eventually, I
just wonder who...

>Gold records have been produced on Falcon technology.
I'm not doubting you, but can you name some that have been produced
using Falcon digital audio (as opposed to just using it as a plain
sequencer)?

We're using an Atari for our current recording project, but it's just an
ST as we are using tape (analogue and ADAT) for the audio recording.

This is about the 4th time you have brought up this null argument. It
is NOT updates that count it is the quality of the program itself, I
know you would prefer it if a program took 10 years and as many
versions to reach perfection rather than being released as a final,
```

finished and polished product straight away. I won't be stupid enough to argue that Degas or Neochrome are particularly powerfull tools, they are very old and by todays standards very simple. However another thing that you don't seem to understand is that people use programs that do what they need them to do, most Atari users aren't stupid enough to buy the most powerful program on the market when the far simpler and cheaper one does exactly what they need it to do.

What denial! TOS is incredibly efficient, see a Hades or a Medusa and
then tell us we are in denial, the fact is that you are not in
possesion of any of the facts, you are claiming that we are lying
about a machines power and you've never seen one. You can't tell power
from raw specs, you should know that the OS counts for a hell of a lot
and you can only compare machine specs when everything else is the
same eg the OS. Features have very little to do with efficiency, my
typing might be shit but I can read and write English and I'll give

crdit where credit is due, you make a good point and I will aknowledge it, that is no problem. The thing is that you can't make a good point because you are fighting blind, you know nothing about the opposition.

If I had the cash to waste. Looks & sounds like a great machine. Another computer, like the Amiga, that makes me wonder how the world could be so ignorant as to ignore these systems. I'm using an Amiga right now.

If you'll give it to me for the cost of shipping & handling, sure!
Otherwise, sorry.

> What use is a machine without a keyboard?

True..Much of the Pentiums in the retail do not include a monitor. TOS machines do not include a modem and CD-Rom...

Apple's current PowerMac label line do not include a keyboard and monitor. This line is target for those who want customization. However, keyboards will be added as standard in the Q1/97 for all.

Through the get info function, you can set the bare min of memory if you want.
Depending what you are using it for, you can set the memory usage..

>>Macs ship from 16-32 megs. The memory is not an issue.
>
> Of course it's an issue unless of course you get memory chips for
> free.

Considering that the medium range PowerMacs are hundreds of dollars cheaper than a Hades/Direct which are equivelant below the lowend PowerMacs..

Memory is cheap..

> Not enough memory by Mac standards you mean.

I suppose when you are stuck with 1980's apps., four megs should suffice...J

I've got the directors cut and am not sure about the 'lesser' version, but in the directors cut the scene is the one where Deckard (Harrison Ford) chases the replicant Zhora after she polaxes him in the niteclub artists' changing room. There is a shot of a shop front as he searches for her along the street, and the shop is selling -you guessed it!!- Atari. The next shot is shortly afterwards where Deckard hesitates as he climbs down from a small step. As he begins to move away you can see the Atari logo filling the backdrop.

I purchased a Pro-Logic system just to enjoy watching the Atari logo in Blade Runner and Terminator 2 BTW!!! :)

I'd much rather try to use a computer without a modem or CDRom than without keyboard and monitor. 990f all TOS machines have keyboard and monitor when supplied.

Show us your productivity without keyboard and monitor, Petey, being the standard "as supplied" Mac config.

Maybe THAT'S why he doesn't generally edit too well!!!???

This is a bizarre assertion, considering that Atari itself never had any special monitor/system bundles. That I can remember, anyhow. It was up to the dealers to include a monitor. Same way with most Macs; the monitor and keyboard are not included in the base system price because the idea is that you get to CHOOSE which ones you want.

The inclusion of keyboard with Ataris was solely due to the fact that you didn't have any options on most of the Atari hardware ever sold; even on the machines which had a detachable keyboard there were no non-Atari keyboards available. Which led to such things as spring and even keyswitch replacement kits for Atari's keyboards, since they were so crummy. And expensive adapters to allow you to use IBM keyboards. And so on.

>Only if you allow it.. Macs ship from 16-32 megs.

Most Macs in the UK ship with 16MB, or even less. My 20MB Mac is not
man enough to load Corel Draw 6 without turning on Virtual Memory.
To upgrade the RAM further, I can't just plug in another SIMM, as
it only has one socket. So I have to go to the hassle of taking out
the old SIMM and trying to sell it. Of all the things you can say
about the Mac "memory isn't an issue" is not one of them.

If you care to read the title you will see this is about Falcons but never mind. If someone pays $3000 for a Hades to use as a graphics machine then of course it is unlikely to do anything close to what they need. If they use it to run a huge database or something then they decide they need a few quick pictures of a cartoon dog or whatever then Neochrome will suffice. The point is, it depends.

You don't know this Pete, it a (foolish) assumption.

>Memory is cheap..

It's still cheaper if you don't need to buy extra. Over here a 16meg
DIMM is just under 100 quid, not expensive but that an extra 100 quid
I could spend on something else.

>> Not enough memory by Mac standards you mean.
>
>I suppose when you are stuck with 1980's apps., four megs should suffice...J

I expect it would, I have no idea.

There was a short interview in EQ magazine a few months ago with a producer who claimed the Falcon/Cubase Audio were his 'secret weapons.'

I don't remember his name. I also read about someone who produced a game and short movie soundtrack using CAF. I don't know of any 'gold' record selling artists, but people are using it for serious tasks, right now.

He he he.. Plus you need expensive TOS hardware to go with that.. Don't forget the DSP board will cost an arm and a leg.. What ever happen to 'Power with out the Price" The new moto should be "Pay more for less"

```

'Yawn'

Who is crushing whom? Wintel has always had a bigger pie over the last decade.
Guess what, Apple is still here and the Mac OS clone firms are thriving..

> You've got all of your priorities screwed up. The Atari/Apple rivalry
> is a dead horse! Better that you go over to the Apple/Windows/PC advocacy

Thats interesting...How so that Apple is dying? You have been saying that for
years.. I don't see any painful and terminal death..

I suggest you go down to the news stand and buy the Feb 16 issue of Forbes and
get a CLUE! It's the one with Amelio on the cover..

I trust Forbes over your track record..

> Or you can go ahead and continue to waste your time here. I'll just keep

We live in an imperfect world..

Plus we have low memory apps which would be considered high end in the TOS platform..

>>Considering that the medium range PowerMacs are hundreds of dollars cheaper than
>>a Hades/Direct which are equivelant below the lowend PowerMacs..
>
> You don't know this Pete, it a (foolish) assumption.

Assumption that medium range PowerMacs cost hundreds less than a Hades/Direct?

Here in NA, thats the case..

> It's still cheaper if you don't need to buy extra. Over here a 16meg
> DIMM is just under 100 quid, not expensive but that an extra 100 quid
> I could spend on something else.

So when you get a TOS box, you will pay many times more quid than a medium PowerMac.. What is your point? Plus you have a Mac...Why?

> I expect it would, I have no idea.

```

There WERE available to everyone on the internet... maybe that's the
point that's being missed here. You could have ordered one yourself

for $2.50 (there was NO minimum order) or 10 or more at $2.00 each.
Now you can only get them for the jacked up rate...

Free market works two ways, and if the price is jacked up too much,
the approrpriate response is to not buy them.

the Mav

Considering that my original 520STm (no f) is still banging away quite
nicely, I've never really gotten the point of all of this keyboard
bashing wrt the ST. Aesthetic quarrels aside, ST keyboards are quite

reliable and not quite so overpriced as they appear.

Hardly bizarre, certainly not in Australia, anyway. St's were virtually never quoted without monitors. TT's and Falcons were, because using standard VGA's etc. is an option.

Which type of Macintosh do you have? I didn't know that any of the
PowerMacs had only one SIMM slot. Also, and I'm not trying to refute
your claim, why are you using CorelDraw? It is one of the worst
illustration programs that I have ever encountered.

You just don't get it, do you? You waste your time over here bashing
Atari computers and making a big deal of the Atari/Apple rivalry, when
your real enemy (Microsoft and Windows) is crushing you.

You've got all of your priorities screwed up. The Atari/Apple rivalry
is a dead horse! Better that you go over to the Apple/Windows/PC advocacy
groups and fight for Apple which is dying a painful death at their hands.

Or you can go ahead and continue to waste your time here. I'll just keep
on laughing.

I think that most people would be complaining about the ergonomics of the
Atari keyboards. They aren't curved and there is not wrist support. I
think that buying the keyboard seperately is a better idea because you
can get the one that you want.

Yea, just like the MacPro Plus keyboard that I am using like many other
Mac users. Of course lets not get into the discussion of what a Mac
keyboard
cost, we Atarians suffer the same problem.
The Falcon keyboards are pretty nice, at least compairing it to the old
1040ST I have. But the MegaSTE keyboard on my C-Lab cased Falcon is
nicer
than most all but the most current and most expensive keyboards
available
for most other platforms, mostly at this time, most of the time.
So for the most part, I am mostly happy with the MegaSTE keyboard. Most
of the time it is connected to my Falcon, but sometimes (when it isn't
mostly) I connect a PC keyboard to my Falcon in a tower with a Keyboard
Gizzmo, mostly, but sometime with the Decca from Wizztronics, which most
of the time is available from Toad.

Opps, isn't Ram Doubler an application that fixes the fragmented memory
problems of Macs and utilizes wierd memory locations?
Is there a FAQ to tell me which version of Ram Doubler to use with
the version of the Mac O/S I decide to install?
Can I run three or four versions of Ram Doubler at one time to
be compatible with software that only supports certian versions of
Ram Doubler?
If I rename Ram Doubler to Doubler Doubler will I get twice the Ram?

Yes. Why the "opps" (sic)? Are you suggesting that I may have claimed that
the MacOS has good memory handling? I never did.

No-one in their right mind (this excludes Petey, of course) would claim the
MacOS RAM handling is anything other than cack.

Well, yes, Canada is part of Americas, North America to be exact. But we
are not "American". That's a designation that applies distinctly to
citizens of the United States of America (probably because it sounds cooler

than calling them "United Statesians").

Of course I've been in many parts of the world where people believe that Canada is part of the USA.

"Oh, anyone can miss Canada, all tucked away down there."

I've also talked with Americans who were suprised to hear that Canada was not a Communist country.

"But I don't understand! It's pink on the map."

I had a 660AV at work that required the same card. I bought the
card NEW for $125 I believe. For some reason, Apple decided to use
a different type of slot in these machines (not PCI either).

Now that I don't need the adapter anymore, maybe I'll sell it to
some poor sucker and make some extra money.. :)

I copied the post right from comp.sys.mac.hardware. Got for it and make a few bucks:)

The "Opps" was for the other poster. I felt that he was implying
that Ram Doubler was a "Virtual" memory only solution. If I'm
not mistaken it does a little more than that.
For once I didn't attack what you said :)

>

> MacOS RAM handling is anything other than cack.

I've tried to understand all the adds for Ram Doubler and such,
but I just stuck in a couple of 32's in the 840AV and didn't
mess with any of it. Still, even with 7.5.5 I end up with
out of memory problems everynow and then. I can't image a
50meg frag between applications:). Aside from Quick
Mail I use both Macs for video grabbing and MagiC Mac, which
both require all types of memory management utilites to be
switched off. At least with the Mac I've went from waste not
want not to, filler up with premium.

You couldn't tell it by retail presence. Mac Clones are nowhere to
be found (unless you're already a dedicated mac worshipper) while
what Macs can be found by the non-converted are out of date collecting
dust in the back corner.

At least the cloner (& cloner mail order) vendors actually manage to
make their presence known to the masses. We could tell them that Apple
is already dead and they would never be able to tell the difference.

Virtually NO keyboard provides its own wrist support. The ones you're harking about require the same $5 solution that would work just as well with an ST keyboard. Then there are your beloved curved keyboard: which only works if you happen to conform physically to the maker's preconcieved notions. In this respect they are no better ergonomically than a straight keyboard.

It's a shame that Apple's hinged design didn't catch on. The M$ natural and it's feelalikes are really rather shallow immitations...

>> think that buying the keyboard seperately is a better idea because you
>> can get the one that you want.

This is just an excuse to deal with the fact that Apple tends to neglect necessary components in it's rather overpriced systems.

  Not really, unless you spawn off child processes and have them do stuff.
The basic idea with SMP support was to let people with SMP motherboards
use all of the processors. I think that LinuxThreads (a kernel patch to
allow threaded applications) can put different threads on different
processors, but I'm not sure.

Can you serve or send remote procedure calls using the linux kernal?
I suppose that RPC could be handled above the level of the kernal,
does vanilla linux do it that way?

Actually, neither of you are right. :)

100 MHz 601: SPECint-92 105, SPECfp-92 125
100 MHz 603e: SPECint-92 120, SPECfp-92 105

So, according to SPEC (which is generally regarded as a reasonable comparison benchmark), a 601 is better if you want to crunch floating point numbers, but a 603e is better for integer programs.

However, there are other factors. The 601 is not available with a clock speed higher than 120 MHz. The 603e is currently available at 100 to 240 MHz. The 603e consumes less power, and is also less expensive to manufacture. So, for these reasons, one might say that the 603e does in fact "blow away" the 601, even though it does not if the clock speeds are the same.

(For those interested, a 68040-25 scores 21/15 and a 68060-50 is estimated to score 60/45. The estimate was based on the assumption that the 50 MHz 060 would be 3x faster than the 25 MHz 040. You can find the table I got all these numbers from at
<http://genex.hgu.mrc.ac.uk/~dubreuil/cputable.html>.)

> I also asked a few people that I know on IRC (Mac

>straight about the Mac range.

Some of Apple's 603 or 603e machines are misleading. Probably for marketing reasons (IMHO), Apple crippled some of the 603/603e models with one or more of the following things: a narrow data bus (32 bits instead of 64), a slow data bus (33 MHz), no L2 cache.

The original 603 also has Mac-specific performance problems. Apple's 68000 emulator code was written for the 601's 32K on-chip cache. The 603 has 16K of cache, which seriously hurts emulator performance. (The 603e has a 32K cache.)

> I always knewhis oppinions were out of

|>comp.sys.atari.advocacy, and just found this article via DejaNews.com

I usually don't read this newsgroup either and just accidently read your
post - but nonetheless it seems to be necessary to correct some opinions
concerning OpenDoc that are obviously wrong.

|>   Now, why is it that one can never read a message by an OpenDoc
supporter
|>without seeing OLE described using the phrase "building monolithic
applications".

Is this the fault of the OpenDoc supporter or the fault of OLE? Let's
simply see ...

|>   Let's take, for example, a comparison of Cyberdog (based on your
|>description,since I've never seen it) and Microsoft Internet Explorer.
MSIE
|>also comes with a news reader, a mail reader and a web browser (along
with a

|>cool graphic chat module, and a online confernecing module), but has
|>componetized them enough that they are all separate executables,
although they
|>do all interact with each other, and they too can be replaced if you
really
|>want too (with the replacement still interacting). By that measure,
Cyberdog
|>is more monolithic that MSIE.

I don't understand your point. Just because MSIE can be split into several
apps that can be replaced makes Cyberdog more monolithic than MSIE? Even
without OpenDoc you can have (on the Macintosh) a WWW-browser, a
NewsReader, an email-client ... (continue list with all client services
you need) and the applications will interact (e.g. double-clicking a URL
in the newsreader will launch the appropiate client etc.). You can choose
whatever program you like for a particular service, but you only have to
enter your personal details once (email-address, mail-, news-servers,
signatures, etc.). THIS kind of behavior is standard for Mac-users.
Windows must really lag farther behind MacOS than I ever thought if you
consider this behavior noteworthy in any way. In this case OpenDoc must
really be hard to describe to Win-users ... ;-)

|>   Let's now look at the MSIE Web Browser. From your description,
under
|>OpenDoc this would be considered one part.

No, it wouldn't (it is difficult to discuss several possibilities HOW one
would actually implement MSIE under OpenDoc) ... but let's continue ...

|>   The advantage of this is that all these controls are readily
available.
|>The code for the toolbar is shared by all of MS's applications -- and it
can
|>be used by ANY rogram that wants a toolbar.
|>   And the same deal applies to the WebBrowser window. Ever want to
draw a
|>complicated design for the background of an application you were
writing? Just
|>plop a WebBrowser window into your application, and pass it a URL (on
the net,
|>or a local file) of a HTML document, and it will display it.

THIS is something more exciting ... but this is not an advantage for the
end-user, but for a developer. However, this starts to get closer to what
OpenDoc actually is.

|>>Because OpenDoc parts all share data and interact with each other
seamlessly,
|>>you can build your perfect tool! You can buy a text editor part from
one

monolithic
|>>application that does everything, but may not do everything the way you
|>>like it. It allows for much more freedom.
|>   Which is, of course, EXACTLY what OLE has allowed since version 1
(released
|>in 1991). This is the big lie on Apple's part. They stress that
they're a
|>"better OLE". What they don't say is that they are a better OLE1, and
ignore
|>the fact that they goals were already bested by OLE2 (released 1993),
and
|>completely blown out of the water by ActiveX (OLE3; released Mar 1996).

Well, OLE 1.0 didn't work properly with non-MS-apps (a friend of mine didn't manage to embed Corel Draw-documents into word documents). Even MS-apps didn't work properly (once you moved the original document, it was over). Maybe it works better now (the problem with moving files has been solved by some dirty hacks AFAIK), but let's focus on the comparison OpenDoc <-> OLE 2.0 (both from the end-users' and the developers point of view):

Opendoc ist document-centric (unlike OLE which integrates applications' functionality). This means you start from an empty document and edit it with part editors. These parts can be all different kind of data you might imagine (text, graphics, movies, WWW-pages, ftp-transfers, ...). The parts (of the document, NOT of an application) can be irregularly shaped and can even overlap each other. Furthermore, you can have several parts "active" (whatever this word means for the specific kind of data under consideration) at a time. You can activate a part and (if you have the appropiate editor) interact with it. Now let's compare this with what I know about OLE 2.0 (well, I'm not a Win-user, so this information is rather 2nd and 3rd hand - just correct me where you think I'm wrong): You launch a specific OLE-aware application and work with it. Then you can launch different applications and share information between the applications and even integrate the data from one application into the working page of the other application. But AFAIK the objects on a certain page cannot be overlapping and they cannot have an arbitrary shape. And still you have to launch all big apps separately - yes, the app may consist of several parts, but can you buy them seperately and can you COMBINE them in the way YOU want? Can you e.g. use the spellchecker from Word to correct some text you wrote in Corel Draw? Or do you have to use Corel Draw's own spellchecker? (;-)) Oh, you want to use Word for setting any text in Corel Draw? Then you certainly want to use Excel for all numbers in your drawing as well? And you want to have all these three applications open at the SAME time? Then we might start to consider importing movies and internet documents ... What, you have less than 64MB of RAM? And you STILL cannot have all five data types be active at the same time ...

From the developers point of view you have no official test of OLE 2.0 compliance. This means that OLE is just some kind of Russian roulette since you never know if your applications interact or not. (CI labs can validate your software and check if you comply to OpenDoc specifications.) You mentioned above how it is possible to integrate functionality from other OLE-aware applications. OpenDoc can do the same, but you even can inherit functions of a specific class and MODIFY them to your specific needs.

Finally we could discuss what is done from the user's POV if he wants to share OpenDoc-documents. He can exchange the data with somebody, who does NOT NEED to have the original application that created a part of the document. He only needs a viewer for all part types. Can a Windows user only SEE a Word-document that contains (parts from X apps) if he is running StarOffice on his system (without having all X apps installed)? Can you say "import filter"? I knew that you can!

I could now go into the secturity problems with ActiveX-controls (especially if you download them as binaries over the WWW to make some pages look better), but you seem to be quite competent and probably know more about it than me. I would say you could call it "blow in the water". In German this would mean "a complete failure", since there were already severe security problems with Java code (which HAS some security mechanisms) - MS's idea to not have any proper security mechanism at all is something that should make anybody hope that ActiveX will fail ...

|>> What's even better, OpenDoc is cross platform. It is an open standard
that
|>>is not controlled by any one company, and the source code can be
licensed
|>>and ported to any platform, even Atari.
|> This is the other big lie on Apple's part. OpenDoc is controller by
two
|>companies (Apple & IBM) throught a puppet organization they set up, CI
Labs.
|>(You'll note that all of CI Labs officers are employees of either Apple
or
|>IBM). And IBM's contribution was mainly some old patents for SOM &
DSOM. All
|>present development is being done almost entirely by Apple. This makes
it
|>EXACTLY as open as OLE/ActiveX (except that OLE has now been turn over
to a
|>real outside standards organization). The source code to OLE can also
be
|>licensed and ported to any platform (even Atari), and in fact, already
exists
|>on Win95(Intel), WinNT (Intel, Alpha, MIPS, PowerPC), MacIntosh, and
several
|>flavors of UNIX, which puts in on more OSes and hardware platforms (and
by far
|>more actual machines) than OpenDoc.

I have to agree that OpenDoc is not as "Open" as the word might suggest (on the other hand which service that starts with the word "open" is truly an open service?). But I can't agree if you say that OLE is multiplatform - the only platform where you might WANT to use OLE-aware-apps and take advantage of their powers is Win95 and WinNT (Intel). The other platforms

don't have appropiate applications (except perhaps Office for Macintosh,
which is also an MS app).

Hmmm, let's have a look at this number...

Mac has about 10% of the market (According to some Mac-clone manufacturer, who wants to increase this to 25%!), Micro$oft something like 80-85%. This indicates that there are about 480-500 MILLION Windows-systems out there! Strange, since this number is at least 3 times what Micro$oft themselves claimes to have sold.

And to use your own argument, 480 million Windows-users can't be wrong! Windows is 8 times better than MacOS!

I have a question about my wonderful Power Mac.
Is there any way to play AVI files? My Falcon can play them
with a couple of different programs (MPlayer and AQTPlayer) but there
seems to be a lack of players on the Macintosh.
This is an honest question.

Yes. There is a program called AVI -> QuickTime that will make AVIs
playable on your Mac. The program is only about 8K and all it does
is replace the AVI header with a QuickTime header.

The apps are very efficient, however data is data, picture and
sound files tend to be huge by their very nature. It's nice to have
quite a few megabytes of space to work in.

```

>That sounds more like a conversion program than a player, correct?

Correct. But all it does is change the header so it's quick and doesn't consume any disk space during the conversion process. The modified file will be exactly two bytes larger than the original. I don't know if the program goes both ways or not.

There is an application called AVI-Quicktime that
you should find at most Mac graphics sites that
will do the job for you.

Gezz, now I feel so low for admitting I know
about this:(

>in December. However, a 300mhz one will be on deck by mid '97'...

I understand that higher speeds are available I thought that was
fairly clear, I was talking about how 2 similar Mhz rated chips would
compare. I accept that you misunderstood the point of the question so
forget it.

>The slowest 603e machine being shipped today is the 160mhz Performa 6360,
>Starmax 3000, and Umax C500. No one is shipping 100-120 mhz ones today..
>
>So I stand correct, that 603e's are faster.. What part do you not understand?

I didn't think it was appropriate to compare different speed chips
when taliking about chip power, a 117 Mhz 603e in a Powerbook (I
believe that exists) is not even close to the speed of a 120 Mhz 601
according to the magazines I read and the people that I spoke to and I
wouldn't call that blowing the 601 away.

:
: So you need 16 megs...I thought Falcon users did not need that amount of
: memory because TOS apps are soo efficient..)
:
: So much for the myth..

I upgraded to give myself a bit more room for APEX media to do its magic.
Four megs was plenty for APEX, but sixteen is just sweet! :)

This is my setup:

   MagiC4 running MAGXDESK in 640*480*256 with a large backdrop tile
   Several ACCessories
   Several AUTO folder programs (including NVDI 3 with a 0.5 meg font cache)
   Several apps running in parallel with MAGXDESK

While running CoNnect right now, with a 1000 line scrollback buffer, I
still have 11.5 Megs free ACTUAL memory...

I would only have 2.5 megs free on a four meg machine (with an OS running
that is pre-emptively multitasking, something Mac CANNOT do yet)...

Sad really isn't it! :)

Chris W.

Does that mean that Video for Windows and Quicktime are the same formats,
or does QT have (more or less) built-in support for AVI?

So much for your knowledge! What he refered to is the actual
size of the image in memory. Your thinking of coloring book pictures.
A 640*480 image is only a few centimeters at best. Hardly practical for
DTP on any scale except for the school news letter. The bottom of the
line
cameras, 1600*1200, reasonable for small 3*5 prints, run $3295.00 for
a 40 image Polaroid PDC-2000. Your still playing with K-mart toys.
Your stupidity is only preceded by the ignorance of your statements.

Macs, that have any use whatsoever, are expensive. A "good"
Mac starts at around $3500.00. This excludes your piece of shit.

Mike

THIS IS THE FAIREST MOST HONEST WAY I KNOW TO SHARE THE WEALTH!

Hello!!

Would you like to make thousands of dollars, quickly, legally, with NO CATCH? Then keep reading......please take five minutes to read this article- it will change your life, just like it did mine. It's true! you can make up to or over $50,000 dollars in 4-6 weeks, maybe sooner! I SWEAR I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested, keep reading; if you're not, I apologize for wasting your time.

Here we go, A little while back, I was browsing through these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars in weeks, with only an initial investment of $5! So, I thought, "Yeah, right, must be a scam".
but I was curious, like most of us, so I kept reading. Anyway, it said that you send $1 to each of the 5 names and addresses stated in the

article. You then place your own name and address in the article at the bottom of the list at #5, and post the article in at least 200 newsgroups (there are thousands). No catch, that was it!

So after thinking it over, talking to a few people first, I tried it. I figured what have I got to lose except for 5 stamps and $5, right? Well, guess what....within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But then money kept coming IN, tripling in size and multiplying by 10-20 times the amount that I got the first week! In my first week I made about 2- to 30 dollars. But by the end of the second week, I had made a total of over $1,000!!!!!! In the third week, I had over $10,000 dollars, and it's still growing! This is my fourth week (Nov 13) and I've made about $42,000 TOTAL, and believe it or not the money is still coming in.......

Let me tell you how this works and most importantly, WHY it works...also, make sure you print a copy of this article NOW so you get the information from it, and begin making money.

The Process is very simple, and it consists of 3 EASY steps:

STEP 1: Get 5 seperate pieces of paper and write the following on each sheet of paper..."PLEASE PUT ME ON YOUR MAILING LIST". YOU ARE NUMBER 4. get five $1 bills, and place ONE inside each piece of paper that you have just written on, and fold each piece of paper so the bill will not be seen in the envelope (otherwise, nosey people who like to steal envelopes with money in it will get yours). Put one paper inside the envelope and seal it. Do the same for all 5. You should now have 5 envelopes sealed, EACH having a piece of paper and the $1 bill inside.

NOTE: make sure those words that were stated above are written on each piece of paper. What you are doing is creating a service by this.

This is PERFECTLY LEGAL. Now, mail the 5 envelopes with the paper and $1 in each to the following 5 addresses.

1. Bruce, P.I. Box 63 4700 Keele St., North York, Ontario M3J 1P3
2. Lars Westin Bj�rkv�gen 3 740 12 Knutby SWEDEN
3. D. Hill, 4280 150 6 Ave. S.W., Calgery, AB, Canada T2P 3Y7
4. Mattias W sernanders v�g 1 rum 535 752 61 Uppsala Sweden
5. Jeff Boldrick, RR#2 Tweed, Ontario K0K3J0

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up (5 becoming 4, 4 becoming 3, etc.) editing what you need to edit.

STEP 3: Post your amended article (with your name at #5) to at least 200 news groups (there are around 10,000 of them!!). All you need is say, at least 200. HOW TO DO THIS: If you have netscape 3.0 do EXACTLY the following:

1) click on any news group like normal, THEN click on 'TO NEWS', which is on the far left when you're in the newsgroups page. This will bring up a box to type a message in.

2) Leave the newsgroup box as it is, but CHANGE the subject box to somehting eye-catching, like, "NEED CASH $$$ READ HERE" $$$ or "FAST CASH" !!!

3) Tab once and you should be ready to type. Now, Copy and paste or retype (only once)

THIS WHOLE ARTICLE, word for word, except to insert your name at #5, and to remove #1 off the list, plus any other small changes you think you need to make. Keep almost all of it the same.

4) When you're done typing(Copy/Paste) the whole article, click on FILE in THIS BOX,

right above send, NOT where it says netscape news on the first box. Click on SAVE AS when you're under FILE. Save your article as a Text file to our c: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTILL YOU HAVE SAVED IT. Once saved, move on to number 5 below.

5) If you still have all of our text. send or post to this newsgroup now by simply clicking send, which is right below AFILE, and right above the Cc: button.

6) Here's where you're going to post all 200. OK, click on any newsgroups then click on 'TO NEWS', again (in the top left hand corner of your netscape navigator. Leave the newsgroups box alone again, put your eye-catching title in the SUBJECT BOX, hit tab once you're in the body of the message, and then click on ATTACHMENT, which is below the subject box. You will get another box to come up. Click on ATTACH FILE, then find YOUR FILE THAT YOU HAVE SAVED; click once on this file, and then click OPEN. NOw click on OK. If you did this right, you should see our file name in the attachments box, and it will be shaded green.

IF YOU USE I.E EXPLORER, IT'S JUST AS EASY: Holding down the left mouse button, highlight this article. Then press the "CTRL" key and the "C" key at the same, to copy this article. Then print this article for your records to have the names of those you will be sending $1 bills to. Next, go to the news groups and press "POST AN ARTICLE". A window will open. Type in your headlines in the subject area and then click in the large windows below. If you want to edit the article, do so and then highlight and copy it again. Now everytime you post the article in a newsgroup all you have to reat is "CTRL" and "V" and press POST.

7) That's it! Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 DIFFERENT newsgroups. You See? Now you just have 100 to go!! (Don't worry, each one takes about 30 seconds, once you get used to it). REMEMBER, 200 IS THE MINIMUM. The more you post, the more money you will make.

You are now in the mail-order business and will start receivng your $1 enveloopes from various people all over the world, within days! HINT: THE MORE NEWSGROUPS YOU POST TOK THE MORE MONEY YOU WILL MAKE.

You may want to rent a PO Box eventualy, because of all the mail. If you wish to stay anonymouse, you can come up with a name, such as "manager" or " investor". Just make sure all the address that you have typed in for the 4 people plus yourself are correct, please.

LET ME TELL YOU WHY THIS SYSTEM WORKS!

Out of every 200 posting, let's say I ONLY receive 5 replies, which is actually VERY LOW. So I made 5 dollars with my name at #5. Now, each person who just sent me $1 makes, say, only 200 posting, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. So people send you $1 now-that's $50 you have just made! Next, your new 50 agens each post 200 newsgroups with your name at number #3, or 10,000 POSTINGS (50x200 = 10,000). The average return is 500 at $1 each, so $500. They make 200 postings, which is 5,000 returns at $1 each, which is $5,000 dollars! and finally, 5,000 people make 200 postings with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000 BEFROE YOUR NAME DROPS OFF THE LIST. AND THAT'S IF EVERYONE ONLY MAKES 200 POSTINGS, AND IF ONLY 5 PEOPLE RESPOND!!!!!!

When your name is no longer on the list, you simply take the latest posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5 TO THE NAMES ON THE LIST. PUTTING YOUR NAME AT #5 AGAIN. And start posting again. The thing to remember is, THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND READING THESE ARTICLES EVERY DAY- just like you are right now!!!

So can you aford $5 to see if it really works? I think so..................

People have said, "What if the plan is played out and no one sends you the money?"

So what! What are the chances of that happening when there are TONS OF NEW HONEST USERS AND NEW HONEST PEOPLE who are joining the internet and newsgroups every day and are willing to give it a try?

Estimates are at 20,000 to 50,000 new users, every day with THOUSANDS of those actually joining the internet.

Remember, PLAY FAIRLY, AND HONESTLY, and this WILL WORK, I promise you!!!! You just to be honest. Make sure yhou print this article RIGHT NOW.

Also, try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly.

REMEMBER: HONESTY IS THE BEST POLICY! You don't need to cheat the back idea is to make money!

GOOD LUCK TO ALL PLEASE PLAY FAIRLY, AND YOU WILL REAP THE HUGE REWARDS FROM THIS-TONS OF EXTRA CASH!!!!

One last note: If you try to deceive people by posting the messages with your name on the list and not sending the money to the poeple already on the list you won't get much.

Someone I talked to knew someone who did that and he only made $150 dollars, and that's after seven or eight weeks! Then he sent the 5 $1 bills, people added his to their list, and in 4-5 weeks he had over $10,000!!!

THIS IS THE FAIREST AND MOST HONEST WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING US ANYTHING BUT OUR TIME, $5 AND FIVE POSTAGE STAMPS!

Well, I kept reading up to here... The old chain letter. I must have about 10 years old when I discovered that you would soon use up all the possible victims, although I had to explain it to my demented aunt. That leads me to the conclusion that you are either less than 10 years old or a demented old lady. Cheers.

Thanks for taking the time to read this message! This is about a lady that gave all she could to everyone, including me. Her name is Wendy.

When I was young she became my foster mother after my real mother had abandon me. Never having any kids of her own she became a foster parent. That I got to be in her care was probably the best thing that had ever happened to me. She had other foster children and even ended up taking care of many of the neighborhood kids.

Wendy is a lady that just never gave up and always gave more than anyone could imagine. I no longer think of my real mother as mother but rather Wendy as my only true mother. I know that I�m not the only one that thinks that way either. It wasn�t just kids that she helped it included the elderly, the disabled and the just down and out. What it takes to qualify for a saint is something I never found out, but I know it can�t be more than the things I saw this lady do for anybody. Even people that had wronged her could find themselves looking up at her while she helped them when they were down.

I�m 26 now and many of the things I�m telling you I never really realized until now. Since I was a kid she has helped me with everything from recovering from my mistakes to just being there to say �You can do it... It�ll be okay.� I�ve never been able to make a good attempt at trying to repay her for all she�s done for me and I�m not alone. Many people just have taken for granted the things she�s done for them.

I know by now you�re asking yourself why I�ve posted this letter. Well, to be honest and straight with you it�s because I would like your help. If there�s one thing that I�ve learned from Wendy it�s that, �We are our neighbors keepers.� You know the golden rule, �Do onto others as you would have them do onto you.� Anyway now Wendy is an older lady that is disabled and can�t do as much as she used to. With the disability sometimes expenses can be too much. I now live in Arkansas and can�t be of much help. With no real family I�d like to do something to try to repay all she done for me and many others.

That�s were you come in. See if you can think back to someone that helped you no matter how big or small. Maybe it�s someone you can�t even remember or have lost touch with. For that moment picture Wendy and say, �I�d like to repay that kindness.� I wish you would sit down and write a small note saying �Thanks for being the generous person that you have been!� If you could include something to help out. Maybe it�s a five dollar bill, a book of stamps, even a dollar. Oh and would you also tell her the Steffin sends his love. Her birthday is next month on the 27th and I�m hoping I can make this own a very memorable one.

Thanks for reading and if you choose to help God pless you.
Her address is

optimus@canit.se (Iggy Drougge) writes:

>Does that mean that Video for Windows and Quicktime are the same formats,
>or does QT have (more or less) built-in support for AVI?

Yes. The header used in AVI is exactly the same as the QuickTime header
save for two bytes that Microsoft removed. Apple sued Microsoft
over this and, surprisingly, won. However, since the monitary loss was
insignificant to Microsoft, a court basically sold the QuickTime header
format.

Lets see, $32,000 in $1 bills in one week. That amounts to 32,000 letters. Since the post office does not deliver on Sundays, that means you received an average of 5,333 letters per day. If you sleep for eight hours a day, and spend the rest of it opening 5,333 letters, you would have to open one letter approximately every 11 seconds all day long without rest or food. You won't even have time to pay your bills or do other household chores. You'll also need to rent a truck to drive all that money to the bank and pick up your next load of mail because it will weigh about a ton. That means you'll need to cut into your sleep time and/or open the mail faster.

This is beside the fact that the bank, police, FBI, and the IRS will become very inquisitive over your repeated large cash deposits. Your home will probably be raided once or twice if not outright seized for probable cause of drug trafficing, money laundering/counterfitting, etc. The postmaster general will be after you to explain why you're suddenly getting so much mail. Somebody at the post office will go 'postal' because of the sudden manditory overtime to sort mail. The garbage collectors will fine you for exceeding your weekly garbage limit, and much of it will remain on your lawn since they can't haul it all away. That means the city will be after you as well because of all the trash in your yard (not to mension that it hasn't been mowed in some time since you've been busy opening 5,333 letter a day). BTW, doesn't your finger get a bit sore and don't the papercuts hurt?

It goes without saying though, if you spam your message to 200 newsgroups, and only 15 people are dumb enough to respond and spam out another 200 messages per person, you will have ran out of news groups to continue the chain in. This is because there are only 3-4,000 newsgroups, not 10,000, and only about half of those see a significant amount of activity. Max profit for you is $15 income - $7 (investment + stamps/envelopes) = $8 net. Wow.

Your story is just a weeeeeee bit far fetched.

You were implying that just because the installed base of Macs is 60mil then they must be good, billions of flies eat shit so it must be nice.

We are talking about the space data takes not the space that the program itself takes up. Photoshop takes up a huge chunk of memory before you have loaded any data.

Why? Do you have a problem with the practise of enterprise and the free
market economy in the USA?

If someone has taken the risk of purchasing all these pads to make them
available to the internet community as opposed to the small population
around that shop, then I can only applaud their actions.

> Macs, that have any use whatsoever, are expensive. A "good"
> Mac starts at around $3500.00. This excludes your piece of shit.

Please list this $3500 model.. I paid $899 for mine which was a steal at the time..

Speaking of price..I logged onto Computer Directs home page.. My jaw dropped when I saw the prices on the 040/060 Hades..

$2499 for an 040 box with four megs ram and 850 meg HD..

$2999 for an 060 box with four megs ram and 850 meg HD..

Who actually would buy such yesterdays technology?

Price does not include monitor. For that kind of money, they should take you out to dinner to celebrate your accession to antiquated 040/060 platform..

Forget what? The last 601 Mac will be phased out in January and the top speed is 120mhz.. Apple no longer makes 603e/ 100-120 mhz desktop Macs. The min speed is 160 mhz...

>
> I didn't think it was appropriate to compare different speed chips
> when taliking about chip power, a 117 Mhz 603e in a Powerbook (I
> believe that exists) is not even close to the speed of a 120 Mhz 601

> wouldn't call that blowing the 601 away.

Why not? Comparing PowerBook speed to desktop ones is like comparing apples and oranges.. PowerBooks tend to have a slower archetecture than their desktop ones due to bus and video speed..

A 160 mhz PPC 603e exceeds a 120 mhz 601..

And they're not speed demons either! A 200 mhz 603e is only 12 0.000000aster than
a 120 mhz 604!!! (and it only does 3 instructions per clock cycle)

>Why not? Comparing PowerBook speed to desktop ones is like comparing apples
>and oranges.. PowerBooks tend to have a slower archetecture than their desktop
>ones due to bus and video speed..

SO compare a 200 mhz 603e to a 120 mhz 604!!! The new 6400 is $2800.00,
and can't even do serious image editing! Stock, only 16-Bit color, and
VRAM is only 1 meg. (NON-UPGRADEABLE!) This limits you to only 256 hues
of a color at one time, unless you want to spend more money on a PCI
card! (Oh, the monitor is -not- included in that $2800 price either!)

I know of a much more honest way to share the wealth... GET A
JOB!!! Sure you will end up paying some money to the
government, but look at all the wonderful services you get in
return!! And you will feel much better about yourself because
you won't be stuck behind a computer posting to 200 newsgroups!
You may even make a friend or 2!

As for an article changing your life... try giving a read to
the following -
http://www.gospelcom.net/rbc/salvation/index.html

It will take you a lot further and doesn't cost you $5.00

Between a 120-150mhz PPC604. Depends on other issues like video, cache and HD speed..

>
> SO compare a 200 mhz 603e to a 120 mhz 604!!! The new 6400 is $2800.00,

Here we go again with misleading info. The 6400/200 is $2199 as of last month.
The 6400/200 with the Avid Cinema board installed with 32 megs ram is $2699.

The 6400/180 is $1899...

You should be concerned with Direct/Hades 040/060 pricing. The base price is $2499/$2999 for a 4 meg/850 meg HD conf and does not include pricing.. If you look hard enough, there are a few 040 Quadra 950's around for $1000 new..

The Grey/Blue controller is a a Prototype controller. What do you

mean "NEWER" jags? The ones they just sent out to every store that
are now selling at $50?

  By the way, does anybody know if the Cybermorph units they are selling
now are the ORIGINAL ones, with poster inside and original box
with the unreleased games on it?

>: for $25). I'll includew with the purchase of the Jag several carts like

Apple did not release a new version for the laptops. The latest 7.5.5 will not work in the PB 1400's, so 7.5.3 is. Have to wait for 7.6 until January..

Such power on an obsolete 16 mhz 030..:) You must of been not looking at any Mac Apps if you think the Apex one is head and shoulders..Typical, only Atari bonehead advocates would state this..

> They WILL see the light of day. YOU are what will NOT...

Please explain!

```

Did IBM ever made a PPC computer compatible with Intel programs?

And don't tell me about corporate workstations, I mean something you buy
at a store in the mall.

This is a beginning of a new thread I hope, but it has much to keeping the
Atari spirit alive...though it has nothing to do with portible computers
or any rantings from the Sinclap a.k.a The MacNerd (I hope)

On Sat, 16 Nov 1996, Steve wrote:

> Thank God we will no longer need to deal with the absolute
> stupidity of the Tramiels. Another example of lunacy by the T bro's.

Can you believe people out there are still playing 2600 games? So I don't
see anyone dumping Atari machines in a pit somewhere. And that doesn't
even include EMULATION of Atari systems either. :)

> Join the Telegames list. As a result of the list, 4 new games will

> 4) Zero 5 (Feb. '97)

Wow, can't wait to se Zero 5 on the Jag. The STe game looks awesome
enough.

Hopefully, it will survive as a cult system much like the Vectrex. Too
bad it lost a lot of creditiblity because of Atari and lazy programmers.
:(

> How would you feel about Jaguar shareware and would you be willing to

> Vote for the games you want to see @ Kitten Litter
> http://www.dfw.net/~kitten/

First, make a Jaguar console that allows shareware games to be downloaded
into it. Sony is coming out with a PlayStation that will do the same
thing. Then also offer ST's as a means of a cheap development computer to
code custom games. Maybe someone might be clever enough to make STOS
extensions for Jag games, so game making can be *that* easy! :)

> If there was a need, it'd show up.

No need due to the dwindling TOS installed base plus the ones who have a dual platform.

> computer, thus its need for speed.

Barely does the job.. The Mac does much more and costs alot less.

Sorry to hear that Pete but I'm sure that one day they will make
Kobold for the Mac and then you might not be quite so desperate.

OK Pete your pathertic understanding of Atari systems has been known for some time and your misconceptions have been corected many times but sadly your understanding is still very poor, I will do the best that I can to reverse what you just said in the hope that you will grasp the reality.

"Interesting, you use an [Atari|ST] for newsreading and you have not sold the Classic for years. So why are you pushing the Powermac and PowerTowers if they have not been sold for some time?"

Understand it yet?

He didn't say that, why on earth would you assume that a running demo of an application means that you do not sell any copies of it?

> Don't be discouraged, you will find a sucker one of these
> days.. Who know's Jedi-Girl may want to upgrade..

A 'sucker' that has one hell of a lot more knowledge than you Pete, I'm sure.

I don't think Atari bothered going very far with the 040 and the STpad
was scrapped late in development, but better to scrap it rather than
push it out and let it flop like I believe the Lisa did.

The grey/blue jag controller is called a Power Pad and was intended for the Atari STE series of computers which support the Jagpad. The color scheme matched the color of the STE better than the black one.

A real proto jag stick would be one of the square ones or the one of the original hack jobs consisting of a 7800 joypad with extra buttons wired together with a Star Raiders controller for the 2600.

I don't understand what you mean in this paragraph. Could you please explain it in a different way? I also do not understand the rest of your post. You suggest that the cross-application capabilities of QuickTime are useless because they do little to aide those doing professional video work. You also suggest that QuickTime actually slows down video playback. This is an interesting suggestion because I would have assumed that more time is spent inside the codec than in the generic QuickTime API code. If I am correct in this assumption then QuickTime can not be to blame for poor play back but, instead, the codec would be.

>Now, does it sound like I think that QuickTime is an animation format?

No.

>You had better do a follow-up on your sig line you copied. It was not
>Tom
>Clancy that said that.

Actually, it was. Often times the Tom Clancy newsgroup degenrates into a
PC versus Mac flame war because Tom Clancy makes a great deal of positive
reference to Macs in his books. During one of these threads he stated
what became my signature and I asked for permission to use it. He
granted it.

Hi,

The sale has gone quite well, but there are a few things left to sell, and now I'm pulling out all the stops!

Buy my entire collection of 8-bit stuff for $175 plus shipping! This includes all power supplies and necessary connectors to make the machine do what it needs to do! All items are in perfect working order!

-1 65 xe
-1 130 xe
-1 400
-1 800xl
-2 1050 disk drives
-1 835 modem
-1 xm301 modem
-1 410 tape recorder...how do you make those damn things work?
-various cassettes and disks and carts to make the 8-bit go!
-FREE...2600 with carts to purchaser!
-anything else I can dream up!

I can't do any better than this...if you think the prices are too high, please try to find half of this stuff at this price. Additionally, for shipping cost, with purchase, I will toss in a colour monitor and connecting cable to attach the 65/130 xe to it...these cables are a pain in the ass to find.

References upon request!

thanks.

karl.

About the Grey/Blue controller being a Prototype controller, EGM
magazine did an interview with people from Atari awhile back(when they
still covered the Jag) and the Grey/Blue color scheme was one of the
TEST colors they were using. They had a couple different color
schemes they were working on, but the Black/Red won!! They have a

picture of an Atari employee (I can't remember who) that had a Grey/Blue Jaguar unit with the Grey/Blue controller.

I always cut .sigs as it's only polite, you moronic attitude does no
good, it's standard netiquette to cut things like .sigs out along with
useless quoting. If everyone had your attitude then nobody would do
anything. You have proved you know little about the Mac, less about
the atari, you can't construct a decent argument and you clearly have
nothing better to do with you "fabulous" computer than have poor digs

at other computer users. Don't add having no mind of your own and no
manners to the list.

>> Apart from your inability to chop out someone's .sig when quoting, your

>I know alot about the Atari platform to know when I see blatant denial..

I think that you will find the only way to know a lot about the Atari
is to use one but it appears you haven't even seen one for years.

Yes, the units which are selling dirt cheap. They changed the buttons
to a blue colour. I don't think you have a prototype, unless you are
talking about something which is totally different from what I am.

:   By the way, does anybody know if the Cybermorph units they are selling
: now are the ORIGINAL ones, with poster inside and original box
: with the unreleased games on it?

There are TWO sorts of Cybermorph....one is in a BLACK case, and the
other is in a GREY case. I figure that the Jaguar was going to be the
same black as the 7800 system once....hence the black Cybermorph...
I personally think the unit would have been a lot sharper looking had
they gone this route.

Willy

Being the "STOS" man, you sure outta know about coding in STOS. But at
least with stuff like Missing Link, I was able to get far into it than I
did before and that was for about two years.

Anyway, try writting a game like Heartland in nothing but machine
language. AhHA!! :)

BTW, is it just me or is any C compiler on the ST a big pain to use? :P

If anyone doesn't remember, awhile back I was debating(?) with Peter Sinclap about still not seeing a viable PPC desktop that runs Intel programs. He tried to upped me one by saying they have workstations out that hase the PPC running Windoze NT. But you can't exactly go to Wal-Mart and buy one of those can you?

After reading about what PPC can do when it first came out, I have been awaiting for such a machine to compete with Intel in terms of running DOS and Windows programs. IBM was even planning to have an on-the-fly Intel to PPC translator chip. But to this day, I only see PPC's on PowerMacs.

If what you say is true, working for Apple and all, then I can't wait for this machine to actually be sold on store shelves. And I bet by some means, it can run ST programs as well :)

Eric,

Thanks for not flaming. Sometimes these groups get way out of hand. Anyways, we all know that timelines are subject to delays but it WILL happen. Apple has also announced that we will have desktops by the end of '97 that will do the same (I have been waiting quite a long time myself for such a box!).

Tony

I don't know how hard it would be, but it is already being done for the Sega Genesis. Right now I can subscribe to the Sega Channel from my cable company. They would give me a hardware device that plugs into my Sega Genesis and I hook the cable to it. Then I can download and play as many games as they have on the cable each month (about 25).

Bad news, everybody. I just called today (11/18), and they are all out
as of this morning. Seems someone bought a very large supply of them
just this morning (that's what the lady told me).

Well Fudge! Thought I was passing along some useful info. Anyway, for
those that don't have it the number to call for a free catalog is:
800-826-5432. If you live outside the U.S. (I heard some people do)
send $2. They have all kinds of interesting (and sometimes useful)
items. Later..............................j

Uh, do you guys know that the original poster was talking about the change
in color of the fire buttons, not the numeric keypad buttons?

The controllers in question are *light* grey with *very* blue buttons.

Hint: The controllers are the same light grey as the Atari Falcon
computer.

Hint #2: The Atari Falcon has a 15-pin joypad controller port.

I think these things are rare, but I've heard enough reportings of them to
make me think they were a small production run, and not a proto.

sinclap2954@cobra.uni.edu (PETER SINCLAIR-DAY) said:-

>Interesting, you use a Mac for newsreading and you have not sold the ST line
>for years. So why are you pushing the Falcon and the Hades if they have not
>been sold for some time?

Now, we should all read Chris's last post aloud,

V.E.R.Y... S.L.O.W.L.Y for Peter:

Chris said, the ST line of computers has not been sold for years: any halfwit realises that the Falcon, hades, medusa and DirecT40/60 are NOT ST's. Unless, of course, Peter wants to also claim, on a similar line, that Apple IIe' are Macintoshes?? Similar comparison!! Peter - maybe you should take up boxing as well as janitorial studies?

In article <DzCF81.I6J@ecf.toronto.edu>, On 1996/10/16
pischke@ecf.toronto.edu (David Pischke) wrote

> Actually, Cyberdog is not a monothilic Internet application. It is not an application at all. It is a collection of OpenDoc parts. An OpenDoc part is a small, self-contained module that does one specific task. For example, Cyberdog is made of separate OpenDoc parts -- a mail reader, news reader, web browser, and so on. Because each OpenDoc part is self-contained, they can be replaced without affecting the other parts.
> The idea behind OpenDoc is that instead of companies building monolithic applications that do everything, companies write small parts that do one specific task very well.

First of all, sorry about taking so long to reply -- I don't normally read comp.sys.atari.advocacy, and just found this article via DejaNews.com

Now, why is it that one can never read a message by an OpenDoc supporter without seeing OLE described using the phrase "building monolithic applications". It's amazing -- Apple must have really driven that point home with you guys. Too bad it's wrong!

Let's take, for example, a comparison of Cyberdog (based on your description,since I've never seen it) and Microsoft Internet Explorer. MSIE also comes with a news reader, a mail reader and a web browser (along with a cool graphic chat module, and a online confernecing module), but has componetized them enough that they are all separate executables, although they do all interact with each other, and they too can be replaced if you really want too (with the replacement still interacting). By that measure, Cyberdog is more monolithic that MSIE.

But that's not the point. The essense of Component Programming is not to allow the end user to recreate their apps in some Frankenstein manner. It's to allow programmers to create new application based on very (very!) specific components.

Let's now look at the MSIE Web Browser. From your description, under OpenDoc this would be considered one part. Under OLE/ActiveX, it's DOZENS! For example, the toolbar running across the top is one ActiveX control. The Edit line holding the URL is another. The HTML Windows inwhich the document is displayed in a third. The modules which interpet the Java, JavaScript, and VBScript programs in the documents are three more. And so on, for all the pieces.

The advantage of this is that all these controls are readily available. The code for the toolbar is shared by all of MS's applications -- and it can be used by ANY rogram that wants a toolbar.

And the same deal applies to the WebBrowser window. Ever want to draw a complicated design for the background of an application you were writing? Just plop a WebBrowser window into your application, and pass it a URL (on the net, or a local file) of a HTML document, and it will display it.

Need a scripting language for your app? Well, once IE3 is installed on the user's machine (A step which can be skipped when Win97 is released), you have -three- available (Java, JavaScript, VBScript). Then, all you have to do is expose objects that control your app, and viola. (ie, If your application has an objects called Widgets which understand Whack methods, then scripting engine will handle the rest of the processing of:

```
        int  i;
        for (i=0; i<5; i++)
            Widget[i].Whack;
```

-- or if you prefer basic:

```
        for i = 0 to 4
              Widget(i).Whack
        next
```

>Because OpenDoc parts all share data and interact with each other seamlessly,
>you can build your perfect tool! You can buy a text editor part from one
>company, a spell-checking part from another, a grammar-checking part from
>a thid, a drawing part from a fourth -- instead of buying one monolithic
>application that does everything, but may not do everything the way you
>like it. It allows for much more freedom.

Which is, of course, EXACTLY what OLE has allowed since version 1 (released in 1991). This is the big lie on Apple's part. They stress that they're a "better OLE". What they don't say is that they are a better OLE1, and ignore the fact that they goals were already bested by OLE2 (released 1993), and completely blown out of the water by ActiveX (OLE3; released Mar 1996).

> What's even better, OpenDoc is cross platform. It is an open standard that
>is not controlled by any one company, and the source code can be licensed
>and ported to any platform, even Atari.

This is the other big lie on Apple's part. OpenDoc is controller by two companies (Apple & IBM) throught a puppet organization they set up, CI Labs.

(You'll note that all of CI Labs officers are employees of either Apple or IBM). And IBM's contribution was mainly some old patents for SOM & DSOM. All present development is being done almost entirely by Apple. This makes it EXACTLY as open as OLE/ActiveX (except that OLE has now been turn over to a real outside standards organization). The source code to OLE can also be licensed and ported to any platform (even Atari), and in fact, already exists on Win95(Intel), WinNT (Intel, Alpha, MIPS, PowerPC), MacIntosh, and several flavors of UNIX, which puts in on more OSes and hardware platforms (and by far more actual machines) than OpenDoc.

: Interesting..System 7.5 came with my system as standard..

Mine didn't. See it as an OS upgrade.

: > : No market. Available on the other platforms..
: >
: > If there was a need, it'd show up.
:
: No need due to the dwindling TOS installed base plus the ones who have a dual
: platform.

Well, most needs are catered for on the ST. If there is no market, there
won't be any development.

: > Let's just believe him, he's the expert. BTW, Quicktime is probably the
: > most fucked animation format I've ever encountered. I can't really see any
: > function in it.
:
: Only to you..

Not really "only". Just because Apple added animation, is it great then?
It has amazing demands on the computer, only to play a 320x200 window of
animation.

: > I prefer putting the pictures on photos, then scanning them, for maximum
: > clarity, sharpness and resolution.
:
: Can do that to..But what if you do not have a scanner and film developing
: facilities..?

You mean you live that far off from civilization? Isn't there any
photoshop where you live? Only to you...

If you can afford the toy camera, you surely must afford some kind of
scnner.

: > That is the case with most computer technology.
:
: What is your point?

Your point isn't much wirth. Everything gets cheaper, and, ultimately,
superseded by updated technology.

: > Ironing out bugs is good, adding uselessness just adds more bugs and an
: > excuse to continue development.
:
: What denial..

Only to Sinclap...

: > In the same way that his mouse is inefficient with two buttons. Damn, I
: > must have some real trashy mouse, three buttons and all.
:
: If you say so..

You say so. Denial?

: > If it does the job, then why add anything more? The Mac is a very slow
: > computer, thus its need for speed.
:
: Barely does the job.. The Mac does much more and costs alot less.

The Mac costs a lot, and is not an option for anyone who does not have a
dire need for Photoshop and Quark, the Mac's killer apps, and isn't
computer illiterate.

: QuickTime is not an animation format so your statement is necessarily false
: unless you have never encountered any real animation formats. In that
: case your statement is only vicariously true. Could you please explain
: what you meant?

I have yet to see any good use of QuickTime other than for animation.
Sure, it has lots of add-ons, such as QTVR, but essentially, it's just a
lcunky animation format, with some added-on novelties.

You are genuinely pathetic. Grotesquely bad analogies will do nothing to change the fact that QuickTime is an application level TOY used to satiate apple customers. While everyone else is getting more bang for their buck, Apple is putting TOYS in this weeks update of the OS. While everyone else is getting decent VM (needed to cure the bloat), protected memory and _real_ multitasking, Apple is snookering idiots like you with TOYS.

It's genuinely pathetic when an orphan has more mature core OS options than a company that occasionally is the biggest microcomputer producer.

Next time try; Toaster Oven. Although you'd probably f*ck that up too.

DA vanished long time ago, IIRC one of their products has been upgraded by the people who bought the sources and now complies to the '89 key shortcut standards.

I apologise for the bad analogy but a bad analogy does not make QuickTime an animation format. Also, by what definition would QuickTime be considered application level? A toy is in the eyes of the beholder. I am not being snookered. One could argue that Atari users are being "snookered" as well because they have put up with a single user, non-distributed operating system for so long.

> It's genuinely pathetic when an orphan has more mature core OS options
> than a company that occasionally is the biggest microcomputer producer.

MkLinux has a much better core than TOS. Why don't you use that? Maybe "TOYS" have some value after all?

That's indicative of one of the main problems in the Atari world; the
market is so small that people go out of business, or move on, quickly.
The DA's products were _nearly_ quite good, and with proper development
Vektor, at least, could have been very good.  But as it stands,
it's buggy and underdeveloped.

>IIRC one of their products has been upgraded by
>the people who bought the sources
Do you know who bought the sources?  Are they planning any further
developments?  Rob Perry of Systems Solutions mentioned a "forthcoming"
MagiCMac-optimised version of Vektor, but it never saw the light of day
over here.

>MkLinux has a much better core than TOS. Why don't you use that? Maybe
>"TOYS" have some value after all?

Too late: Atari has had Linux for quite some time. If you wish
to play that game: Mac looses, to EVERYBODY.

No significant number of Mac users has the balls or the capacity
to deal with Linux.They're too used to being spoonfed by the UI.
They would be completely lost under Linux.

Atari options, however, don't require abandonment of the familiar
user interface or of old applications. Linux has this nasty side
effect. It is a shame that this is the only manner in which you
could get _real_ multitasking.

Atarians aren't limited by TOS. MagiC and Geneva effectively replace
the OS. While orphan atarians have these to choose from, the only
options that Mac users have that don't merely sit upon MacOS'es
rather rotting core, is Linux.

MkLinux has even less support than TOS in any practical sense. Linux is far to user hostile for the typical Mac user to deal with as well. I can just see the typical MacInfant attempting to compile their own copy of XAnim... '-p

Soon, Apple will develop yet another entirely incompatible platform out of it's frustration with not being able to deliver Copeland and Mac Users will be much like AppleII users...

It seems the only way for Mac users to get a real OS is to effectively abandon their own platform...

Actually, QuickTime does directly access video hardware.

I don't believe that the linux kernal supports SMP and distributed
applications. The Mach kernal used in MkLinux does and I don't
believe that there is an Atari version of MkLinux. Please correct
me if I am wrong.

> Atari options, however, don't require abandonment of the familiar

So it is a trade off. You trade an architecturally superior operating system
(MkLinux) for a better interface and old applications. Mac users make
that same trade except that their operating system is even more
architecturally inferior. They get more applications and, arguably, a
better interface.

These replacements do not have the architectual strength of linux so
you are still making a trade.

Here are some improvements that the Macintosh should implement.
A key combination to switch through many applications.
Windows that can be resized without being activated.
A way to make a certain application deal with certain files.
It would be nice to not have the creator app open all.
Dynamic allocation of memory.
Easy way to put a picture on the background
Move to swtich extensions to applications.

>
>So it is a trade off. You trade an architecturally superior operating system
>(MkLinux) for a better interface and old applications. Mac users make
>that same trade except that their operating system is even more

Atarians don't need to make such drastic tradeoffs.
They don't need to choose between either a nice interface
or a robust OS. Linux doesn't necessarily require such
spartan measures. It just does if you're using MkLinux.

>architecturally inferior. They get more applications and, arguably, a
>better interface.

Yet Atarians can get an architecturally superior OS and not have
to sacrifice either ease of use or applications. Atarians can have
both; Mac users can have either.

>
>> Atarians aren't limited by TOS. MagiC and Geneva effectively replace

>
>These replacements do not have the architectual strength of linux so
>you are still making a trade.

Macs must make an all or nothing choice. Atarians, and everyone else,
are not so limited. We don't have to deal with what an industrial
strength OS entails to trump the MacOS or TOS.

Atarians don't need to become unix sysadmins just to get a more
robust system, Mac Users do. It's actually quite ironic: in the
end, Mac Users have to become masters of the evil CLI just to get
a decent OS.

Sorry, I don't know. I would imagine that ATI would be responsible for
writing the drivers.

In what respect? The linux kernal does support SMP and distributed
applications?

> Atarians don't need to make such drastic tradeoffs.

I'm not sure what you are arguing. Are you saying that the Atari
implementation of Linux is easier to use than MkLinux for the Mac?

>   Yet Atarians can get an architecturally superior OS and not have

I don't understant what you mean. What OS are you refering to?

>   are not so limited. We don't have to deal with what an industrial
>   strength OS entails to trump the MacOS or TOS.

My point is that you still must make a compromise. How you make that
compromise is a matter of taste.

: QuickTime is a multimedia engine and not a format in any sense.

So, if QT is an engine, what format does that engine use for its files?
Also, it's strange that so many animation programs insist on using QT for
saving/loading/displaying animations.

Apparently you don't realize the full implications of your _QT
as a hardware banger_ statement.

Linux is distributed as source. With the exception of commercial
vendor support, there is likely no difference between what can
be done with the various Linuxen.

Your concept of compromise is rather bizzare. Linux and MacOS are
about as opposite as extremes get. A choice between one or the other
is no compromise; it's a fundemental paradigm shift. This would be
especially so for the vast majority of Mac Users.

More robust, but not industrial strength is a compromise.
Less bulletproof, but more cross (or back) compatible is a compromise.

What you would pass off as compromise is anything but...

I get the impression that you have absolutely no clue as to what
would await you as a Linux user, especially as an MkLinux user.

I wouldn't expect user numbers for MkLinux to exceed those of the
68K platforms anytime soon...

> If you can afford the toy camera, you surely must afford some kind of
> scnner.

Ha ha ha ha.. I want instant results. Don't worry, without developing costs, the camera pays for it self.. Toy camera is being used by more and more professionals. Even Kodak has a line of excellent digital cameras that put Apple's current one to shame. Hopefully the Quicktake 200 will remedy it.

Apparently not, could you please explain the implications to me.

> Linux is distributed as source. With the exception of commercial
> vendor support, there is likely no difference between what can
> be done with the various Linuxen.

It is interesting that you latter claim that I could not comprehend MkLinux when you do not even seem to understand what a distributed operating system is. A distributed operating system allows programs to (easily) distribute chores amongst workstations. The Mach kernal provides such a facility but I do not believe that the linux kernal does. SMP is symetrical multiprocessing which operating systems use to symetrically schedual processes amongst several processors. I believe that only rudimentry support for SMP is available in vanilla linux.

> Your concept of compromise is rather bizzare. Linux and MacOS are
> about as opposite as extremes get. A choice between one or the other
> is no compromise; it's a fundemental paradigm shift. This would be
> especially so for the vast majority of Mac Users.

You are correct. I was using the word compromise incorrectly since compromise precludes choosing an extreme. I still maintain that Macintosh users are still making a reasonable decision by weighing the GUI and API features more heavily than the operating system core.

> I get the impression that you have absolutely no clue as to what
> would await you as a Linux user, especially as an MkLinux user.

Actually, I have been using MkLinux since DR0. I don't understant why you think that that MkLinux is more difficult to use than vanilla linux. They differ only in kernal architecture and that is abstracted away from the user.

> I wouldn't expect user numbers for MkLinux to exceed those of the
> 68K platforms anytime soon...

I would expect this as well but I don't understant your point.

The QuickTime engine doesn't care what format the data is in so long as the data has a valid QuickTime header and it can access a codec that supports the format in question. Actually, I believe that if the data does not have a QuickTime header then QuickTime will attempt to deduce the information that would be contained in the header. Most programs insist on using QT because they do want to reinvent the wheel just to manipulate video.

Does the kernal provide a frame work for distributed applications?
Thanks for the SMP info. I didn't know the linux kernal supported it
to any degree.

> I can't tell if that's what he's trying to say, but if your

I believe that I correctly interpreted his post and that he is, in fact,
wrong. As an interesting note, all linux kernal calls are handled by
operating system code which directs the calls to the Mach kernal. So
even code that directly accesses the linux kernal is portable to MkLinux.

It seems now that you do understand what I said earlier.
Is there an MPEG codec for Quick Time?

> Actually, I believe that if the data
> does not have a QuickTime header then QuickTime will attempt to deduce
> the information that would be contained in the header.

Ok, if that is the case, try running an Autodesk Studio 3D file.
Let it "try".

> Most programs
> insist on using QT because they do want to reinvent the wheel just to
> manipulate video.

Not most programs, only Apple compatible applications. (few PC).
Don't forget where your are.
Are you saying that, for instance, the Video Toaster Flyer
format is inferior because QT is not used?
Now theres a laugh. I may have to get shitty and cross post
this to the Amiga advocacy.

Mike

: >    You're misinformed.

: In what respect? The linux kernal does support SMP and distributed
: applications?

  Yes.  The distributed applications part obviously requires a program
that supports it, but the kernel does do SMP (Admittedly, not well.
That's one of the goals for the 2.1.x series of kernels: get _good_ SMP,
not just SMP).

: >    Atarians don't need to make such drastic tradeoffs.

:
: Yep.. Pretty much sums up the Tos market..

Yup. But, there _is_ development, albeit not as much as on the Mac, Amiga or WinTel, but nevertheless, there is some. Take APEX Media, for example.

: > : Only to you..
: >
: > Not really "only". Just because Apple added animation, is it great then?
: > It has amazing demands on the computer, only to play a 320x200 window of

:
: What denial..The Mac does not cost alot.. He he he he.. Please quote the
: sourse of the high prices...Mac OS machines even cost less many of the name
: brand Wintel machines..

MacWareHouse, for example. Anyway, why buy some big-name PC, they're all the same. They can even be built from scratch in anyone's bedroom.

[.sig snipped]

Seriously, do you now how to handle cutting? I'll tell you.
On the Mac, you mark the text with the mouse, then press backspace, or command-x.

A format is an arrangement of data. A format cannot use QuickTime.
A QuickTime codec can support a format.

>quantity of Jag controllers sell them on the net for $10-15 apiece?

That is what I think. Some tool just bought them all up hoping to double his money over the next 6-12 months. It's great to think that 4Play or someone did this as part of a greand scheme that would have meaning... But if that was the case I think it would have been done earlier. So I suggest that if there comes a time were a person selling pads is a likely suspect--boycott them. Even if it means having to pay more for your own pad (unlikely really). If they had been ProControllers I would have had my order in when I first saw the post...

I posted this last week but Pete didn't manage a response so I guess he didn't see it, so Pete a response would be nice.

Whilst looking through a Mac catalogue that I saw some oddites in the Mac pricing and so decided to ask here about some chip details, Pete replied:

 In article <1996Nov8.192554.1@cobra.uni.edu>
  sinclap2954@cobra.uni.edu (PETER SINCLAIR-DAY) said:-

>The 603e has replaced the 603 and blows away the 601.

Well I knew the 603 wasn't as good as the 601 in the first place and (foolishly) accepted what Pete had said about the 603e. Today whilst in the newsies I tried to find out what sort of performance difference there was between chips and found out that the 601 is actually better

than the 603e. I also asked a few people that I know on IRC (Mac
owners) and they said the same thing so it appears that not only does
he not know about Atari machines he doesn't even have the facts
straight about the Mac range. I always knewhis oppinions were out of
sync but he doesn't even know about the power of the processors. It's
hardly surprising that he can't construct a decent argument.

Ok, tell me where this extension (or codec as you perfer)
is located. I want to be able to display MPEG video from the

desktop (excuse me, finder) using the Apple Video player.

>

I though you said that it would "try" to resolve the files headder.
Why didn't you say it would fail in the first place?

>

God, your learning well from SinPlop. So your saying the QT is a
limitation
on the Mac platform? I don't understand. Please explain how QT
"modernizes"
video playback on other platforms? I wasn't asking for a lesson in
terminology. I'm illiterate remember? I use an Atari. What I was
poking at was your statement to the effect that QuickTime is
THE best way to support video on any platform. You are grossly
mistaken with this statement.

MPEGDSP supports MPEG play back on the Falcon.
APEXFLC.GTP supports AutoDesk Studio 3D files.
AQTPLAYER supports QT playback
PLAYAVI supports AVI playback
and a few others. All without QuickTime.

Mike

I don't know who you talked to, currently the 603e processor exceeds the previous 601 speed wise. The 601's fastest speed that was used topped at 120 mhz.. Currently the 603e fastest speed is 240mhz when PowerComputing ships them in December. However, a 300mhz one will be on deck by mid '97'...

The slowest 603e machine being shipped today is the 160mhz Performa 6360, Starmax 3000, and Umax C500. No one is shipping 100-120 mhz ones today..

So I stand correct, that 603e's are faster.. What part do you not understand?

Perhaps he does do Digital Audio, video capture or something similar?
Perhaps he uses MagiC and runs several applications at once (remember:
TOS/MagiC does not ship with VMEM)? And - Petey-boy - a Falcon's ST RAM is
either 1, 4 or 14 (plus two unusable) megs, 8 would suffice, 4 are a bit
too low (IMHO) and a 1 meg Falcon is a joke.

You could start at http://www.apple.com and I believe that the program
you are refering to is MoviePlayer.

>I though you said that it would "try" to resolve the files headder.
>Why didn't you say it would fail in the first place?

Doesn't the word "try" imply that failure is possible in some instances?
To build an appropriate header, QuickTime needs to understand the
data format. For example, QuickTime can play MPEG files without a
QT header because it understands the data format and can construct
the information on it's own.

I'm not trying to insult your literacy but I couldn't understant what
you where trying to say. Place the blame on me. And could you please

find the quote where is said that "QuickTime is THE best way to support video on any platform".

>MPEGDSP supports MPEG play back on the Falcon.
>APEXFLC.GTP supports AutoDesk Studio 3D files.
>AQTPLAYER supports QT playback

>and a few others. All without QuickTime.

Actually, I think that you are proving that QuickTime (or any system wide multimedia engine) can be of use. All the programs you listed must share some common functionality that each needed to reimplement. QuickTime gives programs a easy way to manipuate multimedia data without duplicatating common functionality. I am not suggesting that other systems do not or could not exist. The ImageVision Library that is part of IRIX is also quite nice.

I'm not defending Peter but in some ways the 603e chip is better than the 601 chip. The 603e chip can complete more integer instructions per cycle than the 601 but less floating point instructions. The 603e chip can have a higher cycle speed than the 601. The 603e also consumes less power than the 601.

If it's from "Flight of the Intruder", it is by Stephen Coonts, if you care.

> They actually do cost about that much. However, Petey-Boy is leaving out some VERY important details. To begin with: they are all rather low end by current standards. Also, Cyrix continues to earn a bad reputation. The aformentioned $800 is essentially a souped up 486 clone. REAL motherboards (w/ that CPU) go for approx. $100. That Pentium board is rather skanky too. They don't sell packaged systems that slow anymore (100Mhz). You'd have to go to a cottage hacker shop to find such low end hardware on a PC these days. These are the kind of stores that MacVocates typically like to sneer at. BTW, a whole Pentium 100 system can be had for $1100 these days. Mac Lusers are getting charged $1100 for a $300 piece of hardware (real value).

As usual Jedi-Girl has got it all wrong. All I did was correct the prices to one that seemed confused. In no way did I defend Apple's offerings. I agree, Apple's PC cards are pricey. I did install a Pentium card at work the other day with ease.. Does work. I give Apple credit were credit is due, true plug n play despite the price..

> You can get a P6/200 & ASUS MB for less than any of these 'Mac Bargains'.

Which brand? Cheaper than a Moto box?

>
> Sure they're cheap by Apple standards. That 'standard' should warn anyone away.

Whats cheap? I don't think those PC cards are cheap. Knock off $300 more likely..

A half-truth can sometimes be WORSE than a like. It is true that the prices quoted were correct. I corroborated that. I could also give a vendor on the web that has those prices NOW. However, your total unwillingness to back up what you blather is not the issue here.

However, there are some very important other details that while not refuting your prices do the same to discredit them as a refutation would.

> Apple's PC cards are pricey. I did install a Pentium card at work the other day with ease.. Does work. I give Apple credit were credit is due, true plug n play despite the price..

They still charged you as much for a puny little card w/ a cpu on it as the entire equivalent system would have cost you. You just have a high tolerance for Mac abuse.

$300 + <plug & play> != $1200...

>
>> You can get a P6/200 & ASUS MB for less than any of these 'Mac Bargains'.
>
> Which brand? Cheaper than a Moto box?

I said which brand, you MORON. The ASUS price is about average and the same can be said of Intel, Biostar, Tyan and the other bigger names.

Thank heavens. The thought of someone as patently evil as Clancy being a
Mac advocate makes even Windows 95 seem attractive.

Actually for newsreading, the ST would be fine, but we haven't sold
them for years. No, I am determined to find a use for this Mac on my
desk. Something easy on it, something it can handle without crashing.

Something it can do when I am not demoing MagiCMac and Atari software
to Mac users that come into our shop.

Petey-boy, as soon as you start showing that you don't even know about the Mac's weak points, Chris was wrong about the name (it's "Copy Doubler"), but _with_ the "Copy Doubler" software, the Mac's disk operations are about as "fast" as the original GEM desktop file operations (without Kobold, MinixFS or the like).

BTW: Apple has just lowered the German prices for all PowerMacs: the cost DM 1,000.-- less now (tells you about Apple's price policy here, they had no problem asking 1,000.-- DMs more until the clone Macs came to Germany).

And before you ask: 1,000,-- DMs are 666.67 US$.

Thorsten

In the U.S. the difference between the PowerMac 6400 and the Performa 6400 is:
That the PowerMac version is only available in the k12 and higher ed market.
The Powermac version is decontented which means instead of a modem, an ethernet
is included and has no software bundle. The Performa includes a 28k modem and
software bundle. The internals are the same...

Apart from your inability to chop out someone's .sig when quoting, your arguments are weakened immensely by your lack of knowledge of the Atari platform, and also by your poor standards of literacy.

Actually Guenther, the package is called Speed Doubler, at least in North America. The "Copy" portion enhancements are called "Speed Copy"

Not to knit pick, but I wouldn't want to confuse little Peetey ...

Apple's "Fire Sales" over the last year are more to do with bulging warehouses and slow sales than competition from clone makers.

At least this is what the Mac mags have been writing for the last year.

All the best,
Chris

Yea, just like the Mac Clone users have to pay. The Clone
manufactures have to pay to use the Mac O/S on their machines
which the user ends up paying for in the price of the machine.

Same thing.
>

Thank God! Of all the Mac apps i've used, and i've used a few,
DeBabbleizer is about the only one I would like to see ported to
TOS. Graphic Converter is pretty nice, and being shareware, it
blows away most commercial Apple apps.
So much for the Mac market. It's dying a slow death.
One can only hope with all the programmers jumping to Win apps
that the boat will capsize :).

The resolution is still shit. It's just a novility for those who can
afford
one. The quality digital cameras still are over $10K. And you forget you
can not mention quality and low cost when you are refering to Apple for
anything. If you want REAL quality, have your slides put on a CD. That
is
how the professionals do it. School kids can still dabble in their
finger
paint I guess.

Because Apple made them, and people still use them.
Just like ST's. Each platform has a dark history,
it just seems that Apples is a little darker than
Ataris, thus the compairson.

Unfortunately, no. I would have loved to have one of those, I was able to borrow one from engineering when I went on a trip once, and it was great. Much better than hauling around my STacy.

Actually, Clancy used to be featured in Macintosh advertising in the late 80's, early 90's. I think he was in that "What's on your Powerbook?" series.

Hello !

I have recieved three registrations for the old versions
of MG-FTP.
From two people I have got the address, but there is one
missing.

So if the one who had registered remember the fee he had
given me and the way he gave the money, please write
an EMail with your address, because else I cannot give
you the key for the next version !!

So long,
  Michael Guse

Probably out before it's time like all Atari products. HP came out with palmtop PC's which sell between $200-$300 I think, and they are basically the same type of machines as the Portfolio but smaller. They even had articles about it (portible computing) in the old Current Notes issues. I rather that than to lug some stupid ol' laptop :)

I think JTS is licensing Atari technology to companies that can make use of it. I know they do this with older games like Tempest.

[Now we get the the thought provoking statement.]

> I thought the Newton is a neat little machine?

Question mark meaning you're not sure...

Well as Tom Servo would say, "Woopie-$%^&!" :)

Actually the HP Palmtop supports VGA graphics and has other niceties such as
an infrared port that go beyond the Portfolio. But it did come out
considerably later than the Portfolio.

I played with one at an Atari show in Chicago. If they would've
released one, I would've bought one on the spot!!!

Petey-boy seems unaware or unwilling to disclose more VERY important
details. With most digital cameras that mere mortals can afford, the
resolution is indeed shitty. Most haven't even kept up with screen
resolutions (such as 1024x768).

This is VERY different from a real camera. The resolution of a real camera is such that one can enlarge the picture to fill an entire large cinema screen with no loss in clarity. Digital Cameras, on the other hand have resolution more on par with NTSC and inferior to PAL. One only needs to walk into a TV store to see just how soon NTSC, or Digital Camera Quality, images loose clarity.

A cheap (motorized) hand scanner can to truecolor at 300 dpi.
Pete's beloved Digital Camera will do about half that.

This doesn't even touch upon the only slightly more expensive flatbed scanners (SCSI).

Wake me up when these Digital Cameras can manage the same performance as any color scanner at the same price & the image size wont be obsolete in 3 years...

Still slightly less expensive than Mac OS. Just because Apple add the
cost of the OS to each machine doesn't make it free.

>200 camera.

I've seen reviews of the Apple camera (150) and it's rated as one of the
worst ones (just above the Casio QV-10a), the pictures look poor in
contrast, it gives banding on any feature with continuous tones like
sky and also apparently the viewfinder is arse. And this all for a

snip at just under 500 UKP. And you can't link up a quicktake that doesn't exist like the 200.

>> There is a limit to how far you can take a product, if it isn't broken
>> then don't fix it. There is no point in just adding features that
>> virtually nobody will ever use just for the sake of it.
>
>What an excuse. There will aways need to be an upgrade to remain competitve
>and iron out bugs..

And if there aren't bugs and little competition? The Atari OS has remained more compatible and stable than virtually any other that springs to mind, you either get incredibly complex programs that bug out like mad or just don't ever seem to crash. Most products have been built up and updated through years and years, any bugs that aren't found yet aren't worth fixing. This genuinely isn't an excuse, I can't think of any feature that I want added to any of my main software products.

>> Your keyboard must be incredibly inefficient with all those extra
>> keys then.
>
>In what way?

You said (in the bit you conveniently snipped) that a one button mouse was more efficient than a 2 button mouse just because it has 2 buttons, therefore your keyboard must be more inefficient than mine.

>> The recieving end of what? When it is percieved to be overpriced by
>> people that haven't seen it (especially by you) then this means
>> absolutely nothing to me.
>
>PhuleAze..An 030 in 1996! Nuff said..

Again, no reason, no argument. You haven't ever seen it but you have decided to dislike it straight away. Hardly a reason to reject a machine.

Hi,

I have several accumulated Atari items that I'd like to sell.
The reason is not only growing disenchantment with the
support of Atari products by not only the 3rd party developers,
but also a seemingly loyal secondary and primary retail market.
I just can't make the things do what I need them to do anymore.
But, I guess my lose is your gain. I have 8-bits, Jaguar stuff,
ST stuff, and just some other stuff and remember: THE PRICES ARE
NOT CUT IN STONE...if you have an ideal price (not free!) then we can talk.
All items work as of Friday at 8:00 in the morning!
Shipping is extra.

ST stuff:
Whoever buys these will get half of my software collection
including a ram disky thing from ANTIC, ST Word, etc. Quite a deal
at no cost to you.

1040STf works perfect and is a cosmetic 9.0! Disk drive perfect, etc.
Includes working mouse and some docs $50

520 ST upgraded to 1 meg...you know the story! Includes mouse and
some docs $40

SF314 (2) disk drives with cables and docs and connection cords $25 each

SC1224 (?) the colour monitor with box. No burn-in works well.
I've never had a problem with it. Docs included. $45

SC124 (?) Mono high res monitor. No docs or box but still works
like a gem. $35

SF204 HDD 20 meg (can you dig it?) hard disk drive. Works well
comes with all software preloaded to make it go once attached to
your Atari computer. $50 (I paid $90 :-()

8-bit computers. As above, all work well and are cosmetically
near mint...at any rate they have been well maintained. All

items come with cords and power supplies, and some come with the
original docs and boxes.

400 you know the story. Includes docs for 400/800. Can I
pay you to tow it away. Cosmetically, this is about as perfect as they come.
$ 20

800XL works nice, just not my cup of tea. Even comes with original box...
hey, it's America! $40

65xe works well. comes with original box. I;'ll include the docs
if I can find them in my closet. $40

130xe How can Toad charge $100 for these things? No box but looks
and works like day 1. $50

1050 disk drives. Nothing fancy, but power supply included. One of
them come with a box, the other...does not! $45 each

835 modem...viva 300 baud! perfect condition! $15

I also have some carts for the 8-bit like Assembly Editor,
BASIC, and some games. Will include with first purchase for
$2 each.

2600 works well but no power supply or docs. Several games.
$15

Jaguar game console plus 3 controllers. All cables, cords, etc.
two controllers are the regular black ones and the other is
a rare prototype grey one with blue buttons (available separately
for $25). I'll includew with the purchase of the Jag several carts like
Alien Vs. Predator, Checkered Flag, Power Drvie Rally, and...CYBERMORPH!
Jag comes with box and most game come with boxes...not all mind you.
whole package...minue proto controller $60

That's all...thanks for looking!

karl.

QuickTime is not an animation format so your statement is necessarily false
unless you have never encountered any real animation formats. In that
case your statement is only vicariously true. Could you please explain
what you meant?

What do you expect? No one supports Atari users but themeselves alone, along
with Apple II users, Commodore Users, Adam users, TI/99, and a whole host
of others......the Atari is not unique. "COMPUTER"="IBM or CLONE" is reality
now.

: Jaguar game console plus 3 controllers. All cables, cords, etc.
: two controllers are the regular black ones and the other is
: a rare prototype grey one with blue buttons (available separately
  ^^^

This is nonsense! If it is a "Rare Prototype", I have 4 of them. The
Blue button Jaguar Controller is merely the controller included with
NEWER Jaguars.....there is one with each new Jaguar you buy, and Atari sent
me one for "free" when I bought my Jaguar, which had "regular" black buttons.

: for $25). I'll includew with the purchase of the Jag several carts like
: Alien Vs. Predator, Checkered Flag, Power Drvie Rally, and...CYBERMORPH!
: Jag comes with box and most game come with boxes...not all mind you.
: whole package...minue proto controller $60

: That's all...thanks for looking!

: karl.

That's cool, so I wonder what types of games could be played on it? :)

As for the infrared port, I read that it wouldn't work on a ST computer because the serial port is not like the PC's. But the direct connection can be used only it's the same as a null modem, one file sat a time. But using Ghostlink can make it easy. :)

Quicktime- the new cross platform video playback standard.
Just make sure that you have each manufactures extension in
your system folder.
You will need one for Radius, Targa, miro.....ect for optium
playback and hope like hell that they are compatible with
the latest Quicktime version. Strap in and get ready for a
jerky, blury rollercoaster ride. Or your can convert your movie
to Apple standard, or should I say substandard quality with
dropped frames and dithered pallet. Almost as good as MPEG
at it's highest compression setting, but the fat is still
included.

I'll bet the 433mhz Raptors don't use it:)

I've got more than a few Atari items listed on my web page. Mostly systems and games, but also a few 8bit computers and misc. stuff.

Check it out at:

http://www.x-net.net/games

Thanks!

Will

Join the Telegames list. As a result of the list, 4 new games will be released for the JAguar. Show your support!!!! Contact Telegames at http://www.telegames.com

```
        1) Breakout2000 (Dec. '96)
        2) TowersII     (Dec. '96)
        3) Worms        (Jan. '97)
        4) Zero 5       (Feb. '97)
```

All can be pre oredered from Bits O' Fun at 1-800-FUN-JAGS. Dave is a great guy and has some deals for you if you order several. Tell him Krunch sent you. :)
Remember, is it the squeaky gear that gets the grease. Make sure you order some of these as they are all excellent games and Telegames has said they will release more based on the successes of this run of games. Help me help you get the games you want! :)
How would you feel about Jaguar shareware and would you be willing to pay money for a hardware add on that allowed it? Developers Welcome.
Vote for the games you want to see @ Kitten Litter

Interesting, you use a Mac for newsreading and you have not sold the ST line for years. So why are you pushing the Falcon and the Hades if they have not been sold for some time?

> Something it can do when I am not demoing MagiCMac and Atari software
> to Mac users that come into our shop.

But still no sale? Don't be discouraged, you will find a sucker one of these days.. Who know's Jedi-Girl may want to upgrade..

```

Sorry, but I'm not sure that I understand your post. I was pointing out that
a statement made by another poster is either false or entirely meaningless.
Are you making a different claim? QuickTime is not an animation format.
I don't understand why this is so hard to understand.

Daaaaah!
No, QuickTime is a method with which different manufactures can
confuse the end user as to which product to purchase.
An example might be, compair the specs between two video capture
cards. Both are advertised to capture 640*480@ 30fps 24bit color,
both include Adobe Premiere, but one card is priced at $350.00 and
the other at $1000.00. Why not just go for the cheaper card if they
both support QuickTime? It's because while each utilize QuickTime
to communicate with the Mac O/S and hardware, both cards provide their
own methods for video compression and file format. Generally these
formats can not be played back on another machine unless that
products specific extension is available to it. Also, cards such
as the Targa or Miro or Radius must be present in the machine
playing back the video to obtain optium performance.
Now, by saving the format with a standard QT recognized type of
compression, the video is available for play on "any Mac", but
at a much slower frame rate and or reduced resolution than the
originating hardware.
So you could say that QuickTime is a good thing for Mac users
in general. It allows Photoshop to load a single frame from a
movie that was compressed with a format compatible with QuickTime.
It will allow compatible QT movies to be played back with Apples
movie player, Quick Flix or Avid Videoshop.....ect.
But what does it offer the person that wishes to produce professional
video output? Not much but compatibility with Apple Machines. It
makes it easier for Bill Gates to make his machines cross platform
compatible.
It all comes down to the capture card's hardware and software. Almost
all of the PCI cards available for the Mac can be used in a (sic)
Intel PCI based machine, or much better yet, a DEC Alpha machine.
The same card that is available for the Mac that mandiates the use
of QuickTime, can be used in the DEC Alpha under Windows NT with
out Apples QuickTime.
With this being the case, what I FIND hard to understand is, what
benifits do you think your machine has because it utilizes QuickTime
and TOS based systems do not?
I have yet to see ANY Mac be able to play back a Studio 3D 24bit
file. Most X86's can pull that off as well as any standard Falcon.
The only saving grace for the Mac O/S based machines for quality video
production software that I can see will be when Light Wave is released
for the PPC. To bad an 040 based Amiga with a Toaster or an 040 Falcon
with Expose will outperform all but the most expensive options for
the Mac. Probably because the DON'T utilize QuickTime.

Now, does it sound like I think that QuickTime is an animation format?

Hell, maybe when Apple starts charging for "Mac O/S 8 you'll be in line.
It will be funny when you have to start purchasing upgrades for the
software
that isn't compatible with the last O/S version you purchased.

Isn't Iowa State 2 and 8? From what I seen on TV their a bunch of
loosers.
Maybe you should get the whole football team to help you out
here.

As usual you type before thinking. We sell C-Lab falcons and DirecT60's every
week.
I am not pushing them, I am selling them to people who want and need them. It
doesn't require a "push" to do this, the ,market is still good for us and we
expect it to continue for quite some time.

I hope that with some luck Atari will get the exposure it deserves.

I know that many of you think that this effort is "preaching to the choir", but you must remember that many people out there who actually remember the days of "Pong" or the "Atari 2600". Just because they think that Atari went out of business years ago, doesn't mean that they wouldn't sit up if they heard a story about Atari. Now I am not suggesting that it will bring Atari back to life or something, but wouldn't it be nice to know that the company we "love to hate" got at least SOME respect?

Thanks!

Dom

A list of AES calls for these tasks would not help because:

a) If you're using the built-in desktop, it doesn't use normal methods for making AES calls, and there is no way to intercept what it does do in later versions of TOS.

b) Even if you are using a replacement desktop, there's no way for GBell to tell the difference between any one dialog and another. There are AES calls for displaying dialogs, but there is no call which says "display a confirm copying dialog" specifically.

Get your facts straight! You can hook up a Digital camera to an ST.

>You tell me since you are claiming to be an expert..As I stated previous on
>Photoline and Steinberg.

Photoline is an equivalent app. It is faster. It lacks layers, for now,
but it has features that Photoline does not have.

When are you going to load a 20Mb TIFF into ANY image editing package
you can find for the Mac, go ahead, pick the fastest one. None will
come close to the speed I posted.

After you are done that, we will do some filter times.

Put up or shut up.

Steinberg has upgraded CAF three times this year. The last upgrade
included support for recording 8 distinct tracks of audio simultaneously.

Not on a Mac, or PowerMac.

Whatever...Mac graphics/animation tools blow away anything Falcon related.. A
wealth of choices to be had...Your asertion that Mac/PC ones look sad in
comparison just confirms that you are talking out of your ass.

I would like to see PPC native apps using an antiquated 060...

Pentium cards cost $1500? Must be fully loaded.. Apple's Cyrix card is below $800 and their Pentium cards is under $1000.. Huge difference..

The 603e has replaced the 603 and blows away the 601. The 6400/200 just destroys the 8200/120. Why is it that Apple still offers a 601 based 8200 which is not available in this side of the Atlantic. Hate to ask how much a 8200 is? Probably the same as a 8500...Only Apple...

Atari apps in gneral do not follow consistent guidelines, were as Mac apps do.
There have been previous Mac apps that failed the guidelines and as a result
failed in the market..

>>ClarisWorks 4.0 is shipped free with all Mac Performas, SuperMac and

Well, in Germany, it certainly did, and it's still available. Bad thing
is, Atari/JTS "sits on the rights" since they bought this neat little
machine. BTW, I've seen a JTS hdd last week.

Because Petey-boy made the "right choice" again and again - he doesn't try to convince _us_ of that, he tries convincing _himself_. This behaviour is pretty similar to that of some Atari fanatics and especially found among Amiga kiddies: they feel insecure and envy those who have made the currently right choice (Pentium w/W95), so they try suggesting themselves that _they_ were right and all the others were wrong when they bought their computers (no matter whether these don't want a Mac, they have to admit to Petey-boy that he was right when he did). Good old Sigmund Freud would also suspect Petey-boy's got a very little pecker, resulting in low self-confidence.

>I don't get it. Maybe you'd be better off using your beloved
>Mac to actually ACCOMPLISH something..

Nhah, who would ever have a computer just to _use_ it?

There is no such thing as "little converter quality" on C-Lab Falcons.

>Once
>you start buying quality external ADC and DAC, you're starting to get
>up towards the same sort of investment as people using other platforms.

Not quite, for the MIDI/music use the Falcon is still quite competitive (otherwise C-Lab would have dropped it meanwhile), it's just that an F030 that can be bought (used) for 500-600 DM (300-400 US$) can't compete with a 5000 DM (3300 US$) PowerMac 7500, and it was never meant to.

Note that I am not accepting Petey-boy's prices, for Macs are not at all cheap in Germany, and because of that (and the crappy MacOS) I'd prefer going for a Linux Pentium or even a BeBox instead.

C-NET can be found on the Web at WWW.C-net.com.
Also if you have the USA channel(which also owns Sci-FI)
You can watch C-net at 5am (central time) on that channel.
dan
(2.50 for one channel or do you get 5 other channels with the sci-fi,
 I have Time Warner cable they give us the sci-fi channel,cartoon network
 history channel,Plex (formly encore +) and Flix for 1.99 a month (unfortaly
 we have to use their cable box to get those channels and we only have one
 box and it's in my room)

I completely stand by what I just said, it is an operating system in
the true sense of the word it is NOT and extension, it COMPLETELY
replaces TOS but unlike most OS's it is also highly compatible
with TOS.

>> What is more exactly, and don't start the Quicktime arse again, thats
>> an *APPLICATION* it may come with the OS but it isn't a part of it.
>

>Quicktime is an extension of the OS... Quicktime does not run under Tos, a

Not my fault that Apple don't have the ability to program on a
platform like mine.

>> Again I've told you, there is a thing called Photo CD, it has no

>web pages.. And no I did not pay one cent for one. I borrowed one..
>
>The technology in digital cameras has been improved vastly, something you would
>not know and have not been folloeing..Typical denier..

I'm not really sure what sort of camera you are talking about but if
you mean those video conferencing style things then you've been able
to use a digitiser like VIDI ST/Videomaster along with a video camera
since the dawn of time. Normal digital cameras have very poor
resolutions (or at least the affordable ones do) so I use PhotoCD
thanks.

>> Again I've told you before, there is no reasoning to your upgrade
>> mentality, why buy the next upgrade when the current version does

There is a limit to how far you can take a product, if it isn't broken
then don't fix it. There is no point in just adding features that
virtually nobody will ever use just for the sake of it.

>>>So TOS must of been ported to PPC...About time... Has only been close to three
>>>years that the PowerMacs have been out..

The recieving end of what? When it is percieved to be overpriced by
people that haven't seen it (especially by you) then this means
absolutely nothing to me.

The game was based off the Movie, not the other way around.

Also, 'Cloak and dagger' is being made into a new Television series. I am
not sure with network tough. I think it will be out next season (or as a
mid-season replacement this season). FYI

Fess up, Stan III. You are back up to your old forged-cancel tricks in
an attempt to muzzle the meow meow community. You might as well save
your

time and effort. With Fluffy the Cat on our side, we are INVINCIBLE!

> the most important thing in all of this is actually not
> to killfile mlb61@bu.edu--because this isn't an article from this
> address--it's a forged troll that is an attempt to get this person
> killfiled--don't do so)

Shit, even Matt's own little sister told him to keep his ass off of
Usenet and to lay off the meowers. If only he had listened. Meanwhile,
you're just trying to deflect the fact that Francois caught you
red-handed forging cancels again.

> [Followups to this article should be made to news.admin.censorship and
> news.admin.net-abuse.misc]

And also to any other newsgroups you consider appropriate. Please
feel free to add to the list! ;)

> [Forged article follows]

Pot-kettle-black served up as third-rate performance art, Stan?

```

```

And then he has the gall to claim that Meowthew is a forger. What a frigging hypocrite this Stan Kalish III is!

> > >>

A coverup artist of Clintonian audacity and Nixonian incompetence.

And meow.

boy - i'm impressed. i wish _i_ could be running an os that was still full of holes - would this increase my productivity ?? - i guess it doesn't matter, 'cos i'd then be able to tell the world how advanced i was, anyways....

damn - bloody tested, established [kinda reliable] s/ware - how on earth am i ever gonna get any work done ?!?!?!?!?!

mattt

Not to worry. Matthew Bruce, the real Matthew, has authorized me to cancel any and all articles _anywhere_, that claim to be from him. And I'm doing so.

The real Matt Bruce isn't posting anything, so killfile if you wish to avoid the forged junk.

If you have the capability of killfiling on "Austria.EU.net" being in the Path line, you will want to do that.

Yet another open NNTP port.

We already dismissed the use of the rest as trivial and
unproductive (even for their stated goal). The only genuinely
non-advertising uses he managed to come up with will be
suited by Mpegs, Avis or Seqs equally as well.

It's much like harking about one of the Office Suites.
They do almost everything except wash your dishes but,
most users don't require such functionality. Much of the
package sits there wasting space on your hardrive and
does nothing except give the producer bragging rights
to irrelevancies in advertising.

Hamilton was a wonderful troll from August a year ago. It should have been allowed to fade gracefully, but, then, the "me too!" crowd picked it up.

: Not their fault, you were using CAB.. Next time use a real browser not that
: certain 8 bit hackk..)

The only 8-bit browser I know is The Wave for the C128, and that's not
even released yet. AFAIK, CAB is W3-compliant, so the fault must be at
the vendor's end.

Bad luck Pete, you just went for a sentence begining with "whatever",
ever time you do this it is quite obvious that you know nothing about
what you are talking about, you admit you haven't seen APEX and yet
you are 'sure' that he is talking out of his ass!!! And unsurprisingly
you don't mention any specific apps, odd that.

What is overpriced to someone is a bargain to someone else Pete,
Powermacs seem very overpriced to me.

Grow up, obsolete they are not. A PPC is not a DSP.

>which is not available in this side of the Atlantic. Hate to ask how much a
>8200 is? Probably the same as a 8500...Only Apple...

An 8200/120 16meg, 2Gig, 8xCD costs 1269 UKP, a 6400/180 16meg, 2.4Gig, 8xCD with 28.8 Modem, surround sound and 3 more expansion slots, and you sy the latter is by far the better machine although it costs 1249 UKP! The only drawbacks that I can see on the 6400 is no Thin Wire/10 Base ethernet support, so is there genuinely no other drawbacks on the Performa because the sounds quite incredibly weird to me esp as the Performa range comes with lots of apps and the TV/Video stuff too. So what's the deal, is this just weird or am I missing something? Does the performa have PCI slots? What sort of performance difference is there between the 601 and the 603e, what sort of speed 603e would compare to say a 120mhz 601?

Another thing cats (aka meow-meows) do!!! the list now includes:
1) meow
2) poop
3) scrath up curtains and furniture
4) take up too much space

add your own here!!!!!

No way, not this time Petey. This is where you are absolutely wrong.
I've tried the rest, Apex is the best.

Who cares about price? I sure don't. Price is for people like you
that settle for a sub-standard PPC from Apple because if "fit
your budget" (more like your mommies budget).

Yea, that is why Radius sells Photoshop accelerators that utilize two
DSP's just to speed up the filter processing. They can bypass all
the slow Mac O/S calls and use simple DSP code while your RISC processor
chokes on the millions of bits of usless crap it has to process.
Nice try...

Read the whole sentence. Just like the Pentium CARDS, meaning a RISC
processor in the PCI slot.

>
> Pentium cards cost $1500? Must be fully loaded.. Apple's Cyrix card is below
> $800 and their Pentium cards is under $1000.. Huge difference..

No way, that is a flat out lie. Those card cost much more than that.
Just more of your bull shit.

> An 8200/120 16meg, 2Gig, 8xCD costs 1269 UKP, a 6400/180 16meg, 2.4Gig, 8xCD with 28.8 Modem, surround sound and 3 more expansion slots, and you sy the latter is by far the better machine although it costs 1249 UKP! The only drawbacks that I can see on the 6400 is no Thin Wire/10 Base ethernet support, so is there genuinely no other drawbacks on the Performa because the sounds quite incredibly weird to me esp as the Performa range comes with lots of apps and the TV/Video stuff too. So what's the deal, is this just weird or am I missing something? Does the performa have PCI slots? What sort of performance difference is there between the 601 and the 603e, what sort of speed 603e would compare to say a 120mhz 601?

I am not sure how the 8200 fits now that the 6400 is here. The 8200 is the same as the 8100/120 which has been discontinued for some time and is based on the Nubus archetecture not PCI. The 6400 has two PCI slots, comm slot, TV tuner slot and video slot.

The 601's top speed is 120mhz while the 603e is currently as high as 240 mhz. The 603e completely destroys the 601. Apple will most likely be phasing out the last 601 machines which is the 7200/120 in NA and possibly the 8200 in the UK.

The 603e processor mhz speeds is equivelant to the same speed on the Pentiums. The Pentium maxes out at 200mhz while the 603e's fastest to date is 240mhz. 300mhz is soon, reportedly in the first quarter/97. Intel is having difficulty in rasing the mhz above 200 for the Pentium Pro..

The 6400 is a better buy over the 8200 due to extras as standard such as integrated subwoofer, 28k modem, keyboard, 8X CD and software bundle..

I'm afraid there are no AES calls for copy/move/delete... the
AES is for primitives, like drag, click, select menu, open window
etc.

>Does anyone have a fuller listing of AES call numbers and their
>meanings?

Check out the Atari Compendium for a full list...

Anthony

Yea, I know what he is talking about. I have a Reply Dos on Mac card
that
a couple of years ago cost $750.00 for a Cyrex 486/66 on the card. I
though
somewhere we were talking about Pentium 133mhz cards. I see in Mac World
Mac Storm has 100mhz cards for $975.00. But a 100mhz is less expensive
than
a 133 which i'm sure puts it over a grand.

You probably wouldn't dismiss text tracks if you were deaf or blind. You probably wouldn't dismiss VR if you were into multimedia design or interior visualization. You wouldn't dismiss 3D support if you wanted to export 3D models that cannot be easily encoded using VRML. BTW VRML is being augmented to support Quickdraw3D geometries so that might become a moot point soon.

They actually do cost about that much. However, Petey-Boy is leaving
out some VERY important details. To begin with: they are all rather
low end by current standards. Also, Cyrix continues to earn a bad
reputation. The aformentioned $800 is essentially a souped up 486
clone. REAL motherboards (w/ that CPU) go for approx. $100. That
Pentium board is rather skanky too. They don't sell packaged systems

that slow anymore (100Mhz). You'd have to go to a cottage hacker shop to find such low end hardware on a PC these days. These are the kind of stores that MacVocates typically like to sneer at. BTW, a whole Pentium 100 system can be had for $1100 these days. Mac Lusers are getting charged $1100 for a $300 piece of hardware (real value).

You can get a P6/200 & ASUS MB for less than any of these 'Mac Bargains'.

Sure they're cheap by Apple standards. That 'standard' should warn anyone away.

>Grow up, obsolete they are not. A PPC is not a DSP.

It is true that the PPC chips are not DSPs but they do have some of the features that one expects in a DSP. We could probably come up with some play examples to see whether a PPC chip or the DSP/68030 performs certain DSPish functions fastest. Personally I would bet that the PPC would come out ahead. A 604e can complete 2 floating-point multiply and add (FMULADD) with 64-bit precision in 5 cycles. It can simultaneosly execute simpler instructions (up to 10 can complete in five cycles) as well.

Hello, I am currently looking for an Atari 5200, game system. I am a collector and am looking for the system as well as any games for it. You can email me at eman9@msn.com or simply reply to this post.

I am looking forward to hearing from anyone who has the system and will offer a decent price for one in good condition.

Thank you

Why?

You can play FLI/FLC/FLH/SEQ/AVI/MOV/FLM/DL movies from one program.
Can you do that on the MAC?

    If he gets too desperate for a particular file format, he could
]   just run Linux. Or, he could just port the relevant code.
    Availability of the Atari GNU C compilier should make that task
    relatively easy.

Are you being deliberately dim? The problem isn't that there hasn't been
a few people who agreed on something, but that people in the Atari
world haven't stuck to "standards", either de facto or universally agreed.

I have plenty of apps released after 1989 that don't conform to your
standards.

I think that these are discontinued here too, it's just stock clearance from what I can see. The point is though, what is the main difference between a Performa and a Powermac? I have heared there is a 6400 Powermac and a Performa, I assume that the PowerMac version is more expensive and yet only appears to have the ethernet extra, what gives?

Here in the states, the PowerMac 7600/132 is now $2299. Amazing Apple still sells the 7500 in Germany. No wonder their German unit is by far their weakest subsidiary because their stuck with yesterday's technology.

Used Powermacs can be had for $500.

This side of the Atlantic, Macs are cheap and the Mac clones cheaper..

> thanks.

No, no no no no.....A digital camera looks like a regular camera. The only difference is that the pictures from the digital camera are downloaded to the Mac through a serial cable hookup usualy through the printer or modem port..

The digital cameras are increasing in resolution quality at the same level pricing as the previous. This will be the case with the upcomming Quicktake 200 camera.

> There is a limit to how far you can take a product, if it isn't broken

What an excuse. There will aways need to be an upgrade to remain competitve and iron out bugs..

> Bad luck mate, keep looking.

Can you point me in the right dirrection?

So you tried the rest extensively? Which ones were they?
With that kind of time on your hands, you should sell your findings to the PC
rags..

> Who cares about price? I sure don't. Price is for people like you
> that settle for a sub-standard PPC from Apple because if "fit
> your budget" (more like your mommies budget).

Oh what a change from the 80's were Atari ST advocates were rubbing it to the
Mac people that their platform was over priced..Mac Jihads pointed out that the
Mac was better due to high res color, superior system software and apps to boot
too plus appropriate R&D funding and don't forget marketing an alien concept
within Atari. Now today, Apple can do all this today still with lower prices..
Competition was the key though.

>> > Didn't think so!! Maybe our esteemed 'friend' had better find a Falcon

ROFL... Actually I get a kick out of this after a long day.. I did make a right choice in terms for what I paid and out of box experience. As for this penis issue, no complaints so far..

>>I don't get it. Maybe you'd be better off using your beloved
>>Mac to actually ACCOMPLISH something..

Oh, I have..Web development, video production, QT uses, games and internet uses..

I am not sure you could buy a monochrome monitor today for the Mac. Not that I have been looking for one. In the age of digital publishing I doubt you will find any monochrome monitors..

Yep, I agree, both Apple and Atari are equally inadequate.

>> RAM Doubler to replace Apple's sluggish Virtual Memory.
>
>Plus System 7.5.5 helps..

Yeah, but why doesn't apple just fix it? I mean, they are still
developing the OS aren't they?

>> Speed Doubler for Apple's inept disk access.
>
>You mean floppy disk that is rarely used..Only Atari..

Speed Doubler also accelerates hard disk access and the result is a
noticeable increase in OS performance.

>> Speed Copy to bring functionality to the copy function.
>
>If you say so..

I say so, BTW so does Connectix...right on the back of the box....

Quote "Improved Finder Functions on All Macs" "Copy and delete files
without delay. SpeedDoubler is faster than the finder, works in the
background and supports multiple copies simultaneously"

>> Speed Doubler for Apple's even more inept 68K emulation on PPC.
>
>True..
>
>> Gee, does it surprise you that more copies of *.Doubler have been
>> sold than PowerMacs?
>

>Cool..Keeps the developer in business..

Oh, I see. So for the Mac, Apple's inability to put full functionality
into the OS is cool cuz it keeps the third party programmers in
business,
yet for Atari, it is a "Hack and Slash"?

Grow up.

Oh, I see. For a Mac it is hook up, for an Atari that uses the same
interface, it is hack and slash?

If this is the best you can do Peter, best you not even answer.

```
>>>You tell me since you are claiming to be an expert..As I stated previous on

>Huh?
```

Wouldn't be the first time a slip like this was made. I seem to recall a post from you comparing PhotoLine to PhotoLine just a few days ago...

>> When are you going to load a 20Mb TIFF into ANY image editing package
>> you can find for the Mac, go ahead, pick the fastest one. None will
>> come close to the speed I posted.
>
>One issue..Where do I get a Hades to compare?

Not an issue, all I want you to do is pick the fastest Mac app that loads TIFF's and tell me what it is, do a load at your end, time it and post it. I will do the same here, well actually I already have.

I would like to know the app you use, so that we can do the same operation here and compare the features to those found in PhotoLine.

>> After you are done that, we will do some filter times.
>
>Whatever you say..

Well you do want to prove that the Mac is faster, don't you?

>> Put up or shut up.
>
>Huh?

Pretty simple sentence, didn't think even you would have trouble understanding it...

>> Steinberg has upgraded CAF three times this year. The last upgrade
>> included support for recording 8 distinct tracks of audio simultaneously.
>>
>> Not on a Mac, or PowerMac.
>>

I can believe it! They are excellent in terms of support and
approachability.

Looks like another excellent year of new software milestones for
the Falcon.

Mr. Sinclair is in my opinion, looking for and enjoying the attention.
He must be very insecure with his Mac purchase.

All the best,
Chris A Computer Direct

Of course we can. We use digital cameras connected to Atari
computers all the time. Where do you get your information from?

You can't hook up a card that gives you 8 simultaneous tracks
of 16 bit Audio and record it direct to disk. The Falcon can...

Something strange. I was on some of the mac groups looking for used floptical disks, I never saw Mr Sinclair-Day's name anywhere. Do you think maybe.....nah! Surely they wouldn't ban him from the mac groups. That would mean he would have to grouse around on other groups to get someone to talk to him. Strange indeed................j

>>MacFormat from the UK..

Pagestream is available for the Mac and what a job that is. I am a beta
tester and have spent hours on it, mostly restarting my Mac.

It is incredibly slow.

In fact, Pagestream on a TT is faster than Pagestream on a 9500.

uhm...equivalent apps...

You said I can't experience the thrill of a BMW, and I pointed out that I can.

I don't need a Mac to do this, and although the technology that you are
talking about does not exist on Atari computers, this doesn't mean it
couldn't. Nobody has seen a need to write the software to play these
cheap simulations.

I take exception to your post claiming I am a nerd who hawk hacks
hardware / software platform. We are a very highly respected business
known for our innovative design and customer service both in the Atari
and the Mac market.

Our systems sell worldwide, they are bought by end users that are not
afraid to be different to be better.

Yeah right, a modern OS should have memory protection, preemptive
multitasking and a dynamical RAM allocation among other things.

Well, they do pretty much, yes. It can't be forced by Apple, but
the guidelines are there and most authors stick to them. Every Mac
program I have ever used has the same keys for cut/paste, for example,
but in the few Atari programs I still use some have different combinations.

> [Re: AtariWorks]
>Besides that, its free...

As it happens it wasn't free (bundled with Falcons) in the UK.

> would I have to pay for a comparable Mac program?

Claris Works is far superior. v2, which is marginally better than Atari Works
came with my machine, the upgrade to v4 was pretty cheap (can't remember

```
exactly, something like 50 quid, which is what I paid for Atari Works).

It's a shame that Soft Logik are so incompetent, as PageStream would
make a useful addition to the Mac's software base if priced right; it's
the easiest to use DTP package I've seen.  Unfortunately, it was always
buggy and slow.  From your comments, it appears they've made it even
worse.

>In fact, Pagestream on a TT is faster than Pagestream on a 9500.
They didn't do v3 for the Atari platform at all, though, unfortunately.

Hi all,
I am pleased to announce that Happy Hippy Productions has just released a new game: the long awaited SUPER TETRIS (from the creators of TRAPPED II). You can download a copy now by pointing your web browser here:
http://newton.ex.ac.uk/general/ug/jones
You can also download some other software, so what are you waiting for, take a look!

: > similar $ and I'll tear my head off and feed it to myself. Other examples
: PLease describe what Apex media is and no doubt a higher eqivelant is
: available..

APEX media is an animation and graphics package for the Falcon030. It is tremendously powerful and has features that make many other graphics/anim packages for PC/Mac look very sad in comparison. Most of all it has speed, thanks to extensive use of the Falcon's RISC based DSP chip. Many functions work in realtime. I don't think I have really seen ANY Mac/PC graphics packages that come close overall. Some have more features, but NONE can offer speed and intuitiveness the way this program does. So there really isn't an equivalent Mac package!

: So TOS must of been ported to PPC...About time... Has only been close to three
: years that the PowerMacs have been out..

With the kind of speed the 68060 Atari clones run at, I think that PPC based clones will simply honk! :)

: > I would still like to know if Mr. Sinclair-Day has actually used a Falcon
: > before, and how it was setup...maybe someone should show him one day and

: > make him eat all those words from over all those years...
:
: Not much there, when the slowest 030 mhz is used..

Didn't think so!! Maybe our esteemed 'friend' had better find a Falcon
owner who has APEX and some other DSP based stuff. I'm sure
Mr.Sinclair-Day will go pretty quiet for a while after that...

Actually, I was refering to Inkjet Printers. Dot Matrix printers may have their faults but, ink dripping across the page isn't one of them.

Anyone with a serious eye for detail will soon tire of any color printer marketed for mere mortals.

Are you suggesting then that MS Office is a better package than ClarisWorks? Is it in your capability to do so? Your line of reasoning here is pretty even but it goes steadily downhill throughout the post.

> > PhotoLine executes, loads and filters faster.
> Yea are thse equevelant?

Yes, of course they are. People use similar packages all the time to perform functions which one can do better than the other. I sometimes use MS Internet Explorer over Netscape Navigator because I like the efficiency and friendliness, and sometime use Netscape because I like the control and

the range of plugins. The word processor Marcel on the ST has some good
functions which Protext hasn't, but if I want a document printed in about
2 seconds, I use Protext.

Once again, you are assuming that one is better than the other just
because it is. Some people prefer a basic CLI, others want a whizz-bang
GUI.

I didn't compare a Falcon to an SGI machine, I just said that the
reasons are similar ie they are great at what they are made for and do
so with class eg Audio Recording on the Falcon and high resolution
graphics on the SGI.

As an aside I just recieved a brochure of Apple stuff (I ordered some
Zip disks from them so they think I've got a Mac I guess) and was
looking at Mac prices. I understand that a 603 isn't as 'good' as a 601
chip but how does something like a 6400/200 compare to a 8200/120, in

real use? I am genuinely interested.

I've got a colour printer and I use it for DTP & Graphics but not for
printing letters and that sort of stuff, why that would be CRAZY!

People spend big dollars on [insert-brand-name-here] computers because:

1) It does its intended job better than the opposition

How well a machine does the task should be thought about first. Goodness of hardware means nothing - a machine with really good hardware may get the job done worse than a lesser machine.

2) In some cases : Phallus size is linked to purchase price

The election of the Tuatapere Under-Sevens Picnic leader.

It's important to the Under-Sevens, otherwise they won't have any food at
the picnic. And you just don't want to deal with unruly Under-Sevens when
they are denied a picnic!

: It's a shame that Soft Logik are so incompetent, as PageStream would
: make a useful addition to the Mac's software base if priced right; it's
: the easiest to use DTP package I've seen. Unfortunately, it was always
: buggy and slow. From your comments, it appears they've made it even
: worse.

I use Pagestream all the time for DTP (my own business and hospital forms for a local hospital). Except for the problems with color information when pasting between documents (must paste between pages, then save out as a new document), the problem with using the "white" fill when shooting to Linotronic (use solid and change color to white) and the need for a fair mount of memory (all DTP needs memory - except for Postscript output), the Atari version of Pagestream is VERY stable and bug free.

Much of the code (I have been told) was optimized 68000 assembly as the author was skilled in Motorola 68000. Pagestream (for its complexity) is very fast! The few problems (they are all well documented and have simple work arounds) are negligible. The combination use of text as text fonts and also as objects (with all attributes) make Pagestream a superb program. I have used it for years for 1270 and 2540 lino output and have had great success. It really shines on a TT. It is disheartening that Soft-Logik dropped support. What a great program!

Hi there!

People have stated in this thread that NVDI is a hack. That is ludicrous!
I compare NVDI to Adobe Type Manager for Windows (or Mac?). That would
seem to be one of the main purposes of NVDI. If you deleted ATM on PC (or
Mac?) you would have a boring system with no font support (similar to TOS
without GDOS).

But then remember that NVDI also accelerates video (nicely too!) and
provides fixes for some of the small anomalies in GEM/TOS.

Just watch how nicely video updates on Ataris with NVDI, and then compare
that against Macs such as LC3. The Mac interface NEVER seems to run as
smoothly even on a perfectly useable Mac like an LC3...

And your winner by a WIDE margin....NVDI!!

Chris W.

Just confirms that the ST color video sucks.. Whats this making most of what you've got? Sounds like you are stating that you can't afford color considering that the ST hardware is sooo expensive..

All I know, I maximised efficiency for what I paid for my setup. I suppose ST users are use to pay more for less..

> "Only Mac", always playing catchup, we've had Pagestream for years.

Ha ha ha.. Remember desktop publishing was invented on the Mac with Pagemaker..

Lets hope Pagestream isn't buggy as the Amiga one was..

Quicktime is in use in many electronic reference tools and just about anything.. Quicktime is a plugin for the netscape browser..

Sheesh.. Now lets ee how the ST is creative with a similar tool if one is

Look for an old movie called "Cloak & Dagger", it was based on an Atari game. The show is full of store racks dripping with Atari cartridges, as well as a computer guru using an Atari 800 (State of the art... I said OLD movie...)

:)

Oh, so every piece of software on the Atari doesn't follow the same conventions and its a major crime...but only "pretty much so" on the Mac isn't a crime then? Huh? Typical Sinclap crap...

>ClarisWorks 4.0 is shipped free with all Mac Performas, SuperMac and
>PowerComputing machines.. If you buy new is around $119.98 from MacZoneand
>includes the Apple internet Connection kit too. If you are a student, the
>price is $69...

Still more than I paid for Atariworks...(especially if I have to buy a whole Mac system to get it!) :)

>However, AtariWorks is not equevalant to AtariWorks..

Never said it was...what I did say was that it does everything I need it to...Don't need Clarisworks...Don't need Mac...Don't need your pointless postings... :)

> You have an Alias for every progam? Thats OK if you only have a few I suppose...

I use alias on the most used apps. I have alias in the Apple menu, launcher and in the HD folders..

> You quite obviously have no idea what these are, MagiC for example is no more a hack than MacOS.

Of course you would state that..An extra cost to add functionality to an overtly overpriced hardware.. Why is this an expensive platform?

> What is more exactly, and don't start the Quicktime arse again, thats an *APPLICATION* it may come with the OS but it isn't a part of it.

Quicktime is an extension of the OS... Quicktime does not run under Tos, a disadvantage..

> You think people really care? I've told you already, a set of macros is far more configurable and cheaper.

How would you know? Have you ever used the tools that I listed? Can't compare macros to the apps I listed.. What denial..

> Again I've told you, there is a thing called Photo CD, it has no startup costs and the photo's are of an infinitely better quality, pay $500 to put a few photos on your web page did you? Sucker!

Yes, but you have the option to add such a camera, but not on the ST.. Photo CD has been on the Mac for years and now it shows up on the ST....Not invented syndrome is prevalant..   Having a digital camera has other uses besides for web pages.. And no I did not pay one cent for one. I borrowed one..

The technology in digital cameras has been improved vastly, something you would not know and have not been folloeing..Typical denier..

>>> APEX media for 100UK Pounds. Gimme a Mac app that even comes close for similar $ and I'll tear my head off and feed it to myself. Other examples exist like Photoline, DA`s software, Steinberg software, and much more. All these apps provide as much if not more features than similarly priced versions for the Mac...

You tell me since you are claiming to be an expert..As I stated previous on Photoline and Steinberg.

> Again I've told you before, there is no reasoning to your upgrade
> mentality, why buy the next upgrade when the current version does
> exactly what you need, there and then?

Whatever...What confidence.. If Steiberg is not being upgraded means that the mighty Falcon isn't doing well in their intended market. looks like the news is out that Steinberg will not be updated and you want new users to invest in this over priced hardware?

>>So TOS must of been ported to PPC...About time... Has only been close to three
>>years that the PowerMacs have been out..
>
> Some things are worth waiting for.

Thats funny, I have not read any official press release on this achievement..

> Yeah I know, waste of time, better just keep clicking the one button.

How is time being wasted? The ST platform must be very ineficient that it requires a two button mouse..

>>> I would still like to know if Mr. Sinclair-Day has actually used a Falcon
>>> before, and how it was setup...maybe someone should show him one day and
>>> make him eat all those words from over all those years...

No need to.. A 16 mhz 030 speaks volume on the state of the platform..

>>Not much there, when the slowest 030 mhz is used..
>
> What? I take it this means "I'm attaking a plaform that I haven't even
> seen, never mind used.".

What comes around goes around.. Not fun on being the recieving end when your hardware is percieved to be overpriced..

I recently installed Gbell on my STe. A limited list of AES
calls were given in the docs, but I want sound samples when
I am asked to confirm whether I want to copy/move/delete files,
among other things.

Does anyone have a fuller listing of AES call numbers and their
meanings?

Thanks in advance,

The hardware today sucks compared to what you can get for less money on the other platforms..

I too have a 6214 and have been fortunate not to have problems as you stated. The 6214 is a bargain when I got it for $895 new with a gig HD space, keyboard tons of software.. Apple has extended the warranty to seven years..

The 6200 line was concieved during the Spindler regime when Apple dropped the ball on quality. However, under Amelio the hardware quality is about rock solid. The 6400 is solid as well as the new PB1400..

>but in the few Atari programs I still use some have different combinations.

Right. Most but not all. Some but most do...Ah, the language here, my friend... :)

>As it happens it wasn't free (bundled with Falcons) in the UK.

Hmm...so you're saying that Falcon owners in the UK had to buy Atariworks separate from their Falcons? I didn't know that...I have seen where some dealers sold the Falcons without the software because it was unavailable at the time but they "rainchecked" i.e., sent it to them as soon as it did become available...

(of course, we are talking about hard drive equipped models here)

>Claris Works is far superior. v2, which is marginally better than Atari Works
>came with my machine, the upgrade to v4 was pretty cheap (can't remember
>exactly, something like 50 quid, which is what I paid for Atari Works).

So I would have to buy a Mac to run this program...thanks, but no thanks. I've said this to Mr. Sinclair but it didn't sink in...(no surprize there!) Atariworks does just about everything I need, its rock-solid, it runs on my Falcon (big strike against Claris Works there!) and it was -FREE- with my Falcon purchased here in the US...along with a lot of other great software bundled with the Falcon...(AFM, SAM, Falcon D2D, etc...) Software that I just can't get on a Mac...(wouldn't want to anyways) So there it is, you like Claris Works on your Mac and I like Atariworks on my Falcon...I'm sincerely happy that you're comfortable with your choice of platform. Well, I'm very comfortable with my choice of platform, so please don't insult me (and the rest of us) by trying to convince us that we made a "bad" choice...we didn't, friend... :)

Sputter...Must of been soo emotional when you wrote this..Lets discuss the facts here..

Apple is incorporating certain components of the Be OS into Mac OS8 to get it to the market by August's MacWorld..

Apple is not abandoning the current OS.. Apple will be releasing major updates twice a year of System 7.. For the next few years there will be two OS's..

The only thing TOS has had since '93' is a barrel down irrelevance..

```
>      The Apple abandonment of MacOS in favor of BeOS is the perfect

Pretty much soo..

> AtariWorks is a very nice integrated program...its rock solid and has
> most of the features I'll ever need. Besides that, its free...How much
> would I have to pay for a comparable Mac program?

ClarisWorks 4.0 is shipped free with all Mac Performas, SuperMac and PowerComputing machines.. If you buy new is around $119.98 from MacZoneand

includes the Apple internet Connection kit too. If you are a student, the
price is $69...

However, AtariWorks is not equevalant to AtariWorks..

It's not my intention to insult, I assure you. Unlike Petey-boy,
I was an Atarian until recently, having had an ST, then an STe, then

a Falcon. So I'm not relying on the sort of guesswork that he is.

All that's happened is that I moved onto a Mac, and found myself
thinking "this is so much better, why didn't I move before?".

Your positioning of the Falcon as a great audio machine is a little suspect,
though, given the very poor quality of the converters for example. Once
you start buying quality external ADC and DAC, you're starting to get
up towards the same sort of investment as people using other platforms.

Chris, Mr. Peter Sinclair-Day has no clue about how to run an
entrepreneurial venture.

For one thing, your business is a leading provider of TOS solutions and
systems.

For a second thing, it is helping to grow the market.

A quick thought - if the Mac market is exploding so, and the Mac clone
market is doing so well, and Petey is so smart, why doesn't Petey start
his own clone firm and make millions, swamping Computer Direct TOS
machines?

Because it isn't at the rate he wants you to think, it isn't at all, and he
isn't.

Keep up the good work.

Thank you for a well reasoned reply at least...(unlike a certain person's
semi-moronic ramblings!

I've only used one Mac...a Quadra that we have at work...its okay, and
its certainly friendlier than the Wintel machines...but I still prefer
my Falcon... :)

>Your positioning of the Falcon as a great audio machine is a little suspect,
>though, given the very poor quality of the converters for example. Once
>you start buying quality external ADC and DAC, you're starting to get
>up towards the same sort of investment as people using other platforms.

So many professionals use Atari's for studio work that I can't help but
believe that what they say is true! :)

We have the Mac Quadra at work, and a Pentium with Win '95 on it...I've
played with both, but I simply cannot do what I do on my Falcon as quickly
or easily...you can get there, (eventually) but with a lot more effort.

    Nah, the ZDNet article just gave me Atari Flashbacks.
    This manuver is worthy of the Tramiels.

>
> Apple is incorporating certain components of the Be OS into Mac OS8 to get it
> to the market by August's MacWorld..

     They are going to create new hardware and new software that will be
     incompatible with old Mac software (MacWeek). This is quite a bit
     different than what you would have us believe. Apparently, Apple
     was not up to the challenge of producing Copeland. So, they choose
to
     cannibalize another OS in one last desperate ploy.

>
> Apple is not abandoning the current OS.. Apple will be releasing major updates
> twice a year of System 7..  For the next few years there will be two OS's..

     ...one of which wont be able to run the old GUI apps. This is a
```

feat that Magic mangages as does NT. There will come to be a situation where PCs, Suns & HPs will be more compatible with Mac software than Apple's own, new, mutley platform/OS.

Apple will produce yet another completely incompatible platform when it is not at all necessary or even productive. Apple will give consumers in general and even older Apple users good cause to avoid the new BeMacs like the plague. We now know why MAE never made it to the x86 platforms...

[deletia]

> >   The Apple abandonment of MacOS in favor of BeOS is the perfect
> >   testament to the futility of Appledom.
>
> Typical denial..

The only one denying anything is you.

By sacrificing what applications library they do have,
Apple may just finally fulfull all of the dire predictions.

Actually, I was using a phone. You were too busy foaming at the mouth to pay attention to what I was saying. Their phone system doesn't even measure up. Yet they expect anyone too take the rest of their tech. seriously enough to buy it.

The information that I was interested in was not there to be had anywhere. Even CyberMongrel can't read what is not there. Although, the comparison I was making was between Linux and MacOS anyways. So, much for superior MacOS Web authoring tools...

I tried several times. The reference you gave was unusable.

> ROFL!! In what way?

They encourage customers to go to competitors. Someone might conclude from this general lack of Mac vendor incompetence that the Mac itself is also incompetently put together.

Or, in the very least, they would be worried about this platform lasting very much longer.

>You said it...Photoline does not have all the features of Photoshop and you
>compare it anyways..

Right. Right next to the sentence that -ALSO- says that Photoshop does
-NOT- have all of the features of Photoline, either...Doing your best
to ignore that part, are we?

>> PhotoLine run on the same Mac9500 outperforms PhotoSlop by an impressive
>> margin, this of course under OS emulation called MagiCMac which brings
>> true 32 bit preemptive multitasking to the Mac. Something you won't have
>> until the next millenium if Apple still exists by then.

>Of course MagiCmac can't use Quicktime, OpenDoc, AppleScripts QuickDraw and
>emerging Apple software technology.. Nice try..

Once again, you've totally missed the point...Anybody can read the above
paragraph and see that the point he is getting at is that even under an
emulator (which are notorious for slowing performance down because of the
overhead) it outperforms Photoshop...Need someone to interpret for you
since you can't/won't grasp the obvious? Nice try anyways...

>> The comparison was between TOS running TOS applications on a 68060 and

>Are you stating that this 68060 box will blow the doors off a 200mhz 604e
>box..?

Once again, its obvious what he is stating here! Whats the matter? Were you emptying the (Mac)trash while trying to answer newsgroup postings at the same time? Maybe that co-operative multitasking Mac OS was really not co-operating all that well, after all, huh? <grin>

>> I asked you to do some benchmarks on a 20MB TIFF and whatever app you

Ya, the poster was talking about older Mac's which do not infact
support serial port speeds greater than 57.6K.
Make sure you follow the rules of the Atari flamers.
When you talk about a 1986 1040ST you MUST compair it to
a 180mhz PPC! If you are talking about a Falcon, you must be
on your knees before the keyboard praying that your are not
struck dead because you are not using the same machine as
Sinplop or have Be O/S painted in rainbow colors on your
bedroom wall!
So there!

Mike

With that kind of consistancy, how can you tell the difference between
you desktop and the application your running. If you have kids, will you
require them to wear uniforms to school and look just like the rest?
>

> can talk about is formatting floppies. What's the floppy obsession?

Ok, you want a real example utilizing a multasking system. Take a QT
movie and get the latest version of Sparkle for your Mac. Now convert
the QT movie to the MPEG format. You will find you can't do anything
else with the system while it is performing the compression.
Now search ftp for a Mac file called QT2MPEG.sit.hex. Unstuff it.
Here you will find a Mac users solution to your non-multasking Mac
O/S problems. Included inside the package, you will find a port
of Mint for the Mac and a program called "just enough TOS" that
you can install on your machine to make it Atari worthy. Included
in the package is an MPEG encoder that will run in the background
under Mint while you can still utilize your machine. Of course you
will have to understand a little Unix, but what the hell, both you
and SinPlop seem to know more about whatever in the universe is in
the making so an old O/S such as Unix shouldn't be much of a problem.
Kind of ironic. The only way to make a Mac multitask is to install
another O/S. And two of the four available are TOS compatible.
Atari's have been doing this for quite some time.
I didn't even say the word floppy once :)

That's two (big) points for Atari now.

More like uses more and does less with it.
I would like to see that 49meg simm.
The Falcon i'm sure is not more expensive than your system. Prove it.
Don't quote Toads add's. They do not have the current prices on memory
listed in on their web site. A 16mb Falcon can be had for less than
$1000.00. Your memory upgrade cost at least $235.00. That means you
obtained your Mac for less than $765.00. If this is true, you surely
don't have the machine you claim to have. Did you pick up a second
hand Mac II by mistake by chance?

Ya, sure. That's why they are bearly making it in the Microsoft invasion
of
the Mac user base.

Ya, I surely want a little overpriced CCD that can put out a 160*100
7fps picture of you ugly face over the internet.
Digital camera? I thought you were talking about video. I don't see
where
connecting a primitive imaging device such as all of the under $2000.00
digital camers are to my Atari or Mac being something to shake my wang
at.

The picture quality is crap on the Mac, and if a driver was wrote for
the
TOS machines to utilize one it would look like crap there as well.
Better to purchase a nice 35mm and a Epson 1200 scanner for your Falcon
or ST. Digital photography technology is way to far away for you to
try to use that for a stick to lean on.

There is no Mac application that can be compaired to Apex. It dosen't
exist.

What is so great about a PPC? What does a CPU upgrade for your machine
cost
to take it to, say, 180mhz PPC? About two grand, right?

> >

No, it won't be a port. I think what he is getting at is the ability to
run

```
PPC software on the 060 based machine, much like the $1500.00 dollar
Pentium
cards for the PPC's to run Dos or Windowz or whatever they do.
It will be interesting to see how you react to this. You support in your
post all of the new and planned Mac clones, yet i'm sure that an Atari
clone
able to run PPC will leave a very bad taste in you mouth.

Just like I said. When was the last time you developed any
useful software or hardware for you Mac. Did you find a creative
way to route your mouse cable? Did you install a spinning mouse
icon?

>

Bruce who? Depends which Mac your talking about.
Just because John Delorian made a bad deal dosen't
mean the car is bad. But then again, i'm sure industry would
say that. The only fact is that Apple was more sucessful than
Atari in the computer market. It does not mean that it is a better
machine for everyone. If it was, Apple would be sharing the
same building as Bill Gates, but we all know that just isn't
going to happen.

Get a life. The equivelant apps statement dosen't apply to the 68000
Mac. It flat out won't run the software you keep bringing up. It is as
dead as the TRS 80. Nobody wants those. Where I work I have seen
thousands in the excess heap. Even the schools won't pick them out
of the scrap pile.
I would also like for you to send some photos all these ST's are
going to.

> to boot.

You had better check up on your Mac facts. Sever dealers advertise
"Brand New" Quadra 950 and Quadra servers. The 950's go for $1500.00
8mb/no hd.

No one interested in computing would waste their money on a Performa
6116.
What a piece of shit. A $135.00 586-133mhz will blow it off.
Ya, were real stupid. How can you justify posting crap like this?
Talk about machines heading for the landfills, cripes, why do you
think they are selling them so cheap?

Da, figure it out. You probably have never updated your O/S. You get
your
network administrator to do it for you. You know the guy that dosen't
have
time to police your illegal post to the usenet?
You know I love it when I check Deja News and see all the canceled
SinClap
messages. How did you manage to get through this time?

If the machine is soooooo " inutive" as you like to say,
and I will actually quote you on this:
"Depends on one's perception.. However, the industry
states that the Mac is the the most inutive and easier to use.. That
is
generaly a fact".

If the machine is "sooooo inutive" why all the "help me with
opentransport"
or "help me with Mac TCP" or "help me with Free PPP" or "help me with
trying to run Adobe Premeier 4.X on my Mac plus with 4mb of ram", or in
your
case "help me view pictures in the alt.binaries.xxx group".

> today...Much cheaper to boot than a Falcon and the Hades..

A bargain compaired to what it cost just a couple of years ago. How many
people do you think gave up on their Mac II's and Quadras an moved over
to Pentiums when they were released? I haven't read anywhere figures
stating that the Mac share of the PC market has increased lately.
More PC's are probably sold in a day than Apple and the clone
manufactures
sell in a week.
A bargin in todays market is the SGI Indy line, some of which can be had
for less than 5K. The screen saver on one of these renders faster than
any application available for the PPC's. If you really want a bargin get

```
a DEC Alpha 433mhz rendering station for about 16K. Even if you could
outfit a Mac with same software (LightWave 3D, ect..) it would come no
where close to the performance of these machines. So you see, you
machines
performance is reletive to your pocket book, not the Apple name on it.

Ain't that the truth!  Harry Browne of the Libertarian Party is _LEADING_
in almost every poll on the net.  And he's certainly a valiant alternative
to the big brother duo Republicrat candidates who are both fighting so hard
to _GROW_ government at the expense of future generations.

Maybe your proprosed game scenario is long overdue?

That wasn't the 'dare' it was to place novice users in front of the
machine and get them to work it out, not look at users who 'always' do
it and were probably told in their I.T. lessons.

>The Mac platform has already graduated to
>CD's while a certain one is still in floppy infancy..

CD's do exist for the Atari and you are infinitely stupid for suggesting that it is still in floppy infancy.

Why monochrome? Isn't the color good enough for wp? No need for monochrome on the Mac because the color is crystal clear.

Pagestream is comming to the Mac. According to an article and screen shots in MacFormat from the UK..I am not sure what the current price of Pagestream is, but PageMaker can be had for $199 from your local school bookstore.

You must have a different diffinition for ease of use and solid. Which is fine because you are use to the Atari way of things. However, a new user may not agree nor is a fact.

You have not specify examples of equevelant apps. Much faster is too broad.. Are you stating that apps with a Falcon is faster than 200 mhz PowerMac which are dropping rapidly in price..

As for CAB, I am sure anything is better. But the ST platform is always paying catchup and not being the first with new innovation. Macs are cheap and will be even cheaper as the weeks go by. With all these internet related apps and the cheap hardware I can find hardly a case for the ST platform..

> I made a comment in my first post about the Atari allowing

You think that is exclusive on the ST? Ever hear of Macros, Quickkeys and Alias? I can put Alias of apps anywere I please...I can put apps in my startup sequence if I want..

Are you sure you have used a Mac?

About now...If not, Umax/SuperMac models are available.. Plus you can buy a kit starting at $899 for the 160 mhz version using the Motorola motherboard with floppy, PCI slots and a Tower with five drive bays..

A 200 mhz 604e kit goes for $1499.. Looks like there will be a Computer Mac shopper soon..

Isn't Toad one of the last place that deals with the ST? Seems like is a popular place to do business with. I bought my Lynx from them..

    So? In what page of computer shopper or at what URL can you find these
    alleged products. Furthermore, where can one find a Mac clone anywhere
    in a retail establishment anywhere near the eastern seaboard?

    Or is this claim like all of your others: quite a bit of hot air?

Greetings, Tony!

I've always wanted to visit the Center of the Universe, so how's about inviting us Atarians (all of us!) over for a visit! <grin>

I've always wanted to try a pint of that stout English beer, too.

<wistful, longing look on face>

<grin>

Take five minutes to read this and it WILL change your life.

The Internet has grown tremendously. It doubles in size every 4 months. think about it. You see those 'Make.Money.Fast' posts more and more. That's ... because it WORKS ! So I thought, all those new users might make it work. And I decided to try it out, a few months ago. Besides, whats $5.00, I spend more than that in the morning on my way to work on coffee and cigs for the day. So I sent in my money and posted. Everyone was calling it a scam, but there are SO many new users from AOL, Netcom, etc. they will join in and make it work for you.

Well, two weeks later, I began recieving bucks in the mail! I couldn't believe it! Not just a little, I mean big bucks! At first only a few hundred dollars, then a week later, a couple of thousand, then BOOM. By the end of the fourth week, I had recieved nearly $47,000.00. It came from all over the world. And every bit of it perfectly legal and on the up and up. I've been able to pay off all my bills and still had enough left over for a nice vacation for me and my family.

Not only does it work for me, it works for other folks as well. Markus Valppu says he made $57,883 in four weeks. Dave Manning claims he made $53,664 in the same amount of time. Dan Shepstone says it was only $17,000 for him. Do I know these folks? No, but when I read how they say they did it, it made sense to me. Enough sense that I'm taking a similar chance with $5 of my own bucks. Not a big chance, I admit--but one with incredible potential, because $5 is all anyone ever invests in this system. Period. That's all Markus, Dave, or Dan invested, yet their $5 netted them tens of thousands of dollars each, in a safe, legal, completely legitimate way. Here's how it works in 3 easy steps:

STEP 1.

Invest your $5 by writing your name and address on five seperate pieces of paper along with the words: "PLEASE ADD ME TO YOUR MAILING LIST." (In this way, you're not just sending a dollar to someone; you're paying for a legitimate service.) Fold a $1 bill, money order, or bank note inside each paper, and mail them by standard U. S. Mail to the following five addresses:

1- Fern Suarez
Mallorca 112
Hato Rey, P.R., USA, 00917

2- Philippe
2104 De Mexico
Chomedey, Laval
Quebec, Canada
H7M 3C6

3- Natalie Jansen
Lancveldlaan 18
5671 CN Nuenen
Holland

4- Chad Collier

2785 Cold Springs Rd. #49
Placerville, CA 95667

5- Steve Boltinghouse
1009 Bird St.
Hannibal, MO 63401

STEP 2.

Now remove the top name from the list, and move the other names up.This way, #5 becomes #4 and so on. Put your name in as the fifth one on the list.

STEP 3.

Post the article to at least 250 newsgroups. There are at least 19000 newsgroups at any given moment in time. Try posting to as many newsgroups as you can. Remember the more groups you post to, the more people will see your article and send you cash!

STEP 4.

You are now in business for yourself, and should start seeing returns within 7 to 14 days! Remember, the Internet is new and huge. There is no way you can lose.

Now here is how and why this system works:

Out of every block of 250 posts I made, I got back 5 responses. Yes, thats right,only 5. You make $5.00 in cash, not checks or money orders, but real cash with your name at #5.

Each additional person who sent you $1.00 now also makes 250 additional postings with your name at #4, 1000 postings. On average then, 50 people will send you $1.00 with your name at #4,....$50.00 in your pocket!

Now these 50 new people will make 250 postings each with your name at #3 or 10,000 postings. Average return, 500 people= $500. They make 250 postings each with your name at #2= 100,000 postings=5000 returns at $1.00 each=$5,000.00 in cash!

Finally, 5,000 people make 250 postings each with your name at #1 and you get a return of $60,000 before your name drops off the list.And that's only if everyone down the line makes only 250 postings each! Your total income for this one cycle is $55,000.

From time to time when you see your name is no longer on the list, you take the latest posting you can find and start all over again.

The end result depends on you. You must follow through and repost this article everywhere you can think of. The more postings you make, the more cash ends up in your mailbox. It's too easy and too cheap to pass up!!!

So thats it. Pretty simple sounding stuff, huh? But believe me, it works. There are millions of people surfing the net every day, all day, all over the world. And 100,000 new people get on the net every day. You know that, you've seen the stories in the paper. So, my friend, read and follow the simple instructions and play fair. Thats the key, and thats all there is to it. Print this out right now so you can refer back to this article easily. Try to keep an eye on all the postings you made to make sure everyone is playing fairly. You know where your name should be.

If you're really not sure or still think this can't be for real, then don't do it. But please print this article and pass it along to someone you know who really needs the bucks, and see what happens.

REMEMBER....HONESTY IS THE BEST POLICY.YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE THE BUCKS! GOOD LUCK TO ALL, AND PLEASE PLAY FAIR AND YOU WILL WIN AND MAKE SOME REAL INSTANT FREE CASH!

*** By the way, if you try to deceive people by posting the messages with your name in the list and not sending the bucks to the people already included, you will not get much. I know someone who did this and only got about $150 (and that's after two months). Then he sent the 5 bills, people added him to their lists, and in 4-5 weeks he had over $10,000!

TRY IT AND YOU'LL BE HAPPY!!! :o) !!!!!!!!!

ARE YOU NUTS?????? Your provider for Internet Services is ripping you OFF! The Internet was designed to be FREE!! PLEASE PLEASE let us show you where/how you can get it free! Please Read Below.

JUST FOR READING THIS YOU WILL GET A FREE EMAIL ACCOUNT!!!!!!

NEVER EVER pay for Internet Access AGAIN!!! E-V-E-R!

This Amazing Course on Audio Tape teaches you STEP by STEP what your Internet Service Provider doesn't want you to know!

* How to get FREE DIAL-UP PPP Internet Access!
* How to Surf the Web,Newsgroups,and EMAIL Anonymously/Untraceable!
* Where you can get FREE Email Remailing!
* Where you can get FREE Email Addresses!
* Where you can get FREE Access to SMTP (Outgoing email)!
* Where you can get FREE Access to News Servers!
* Where you can get FREE Web Pages!
* How to get FREE Internet Tools for Email, News, WWW, Etc.!
* How to get free accounts on BBS's!
* How to Manipulate your IP Address!
* MUCH MUCH More!!!

No matter where you live we guarantee you will get FREE internet access legally and anonymously!

ONLY ------> $29.95 Delivered (WORLDWIDE)
Act NOW supplies are in Limited Supply!
FAST SERVICE!

BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!

As an added BONUS! We will show you how you can make phone calls that are not traceable back to you - 100% Legal! Very handy for those important calls you don't want anyone to find out about!
But you absolutely MUST respond within 10 DAYS!

BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!BONUS!

Fine...What if you don't care about audio recording? Why should the user pay
for it?
> How much for a Mac that can do that?

Irelevant. How much would it cost to bring a Falcon to 7600/132 level with
Video S in?

> The RAM upgrade is overpriced, we sell them for 200.00 Cdn.

Still expensive...

>
>You mean hacks. As for memory usage, Mac OS and Windows do more and cost less.

You mean - by hacks?

>Considering that machines come with 16 megs, not an issue. I upgraded to 49
>megs, and my setup is still cheaper than a Falcon.

Well, unless you hacked into a bank, this is quite impossible.

>apps like ClarisWorks have no equal on the ST platform..

Thank Dog. We don't need no hacks like ClarisWorks.

>Don't expect WebStar, PageMill, Claris Homepage and many other

...hacks...

>soon on the ST platform. Heck, you can't even

...hack...

>up a digital camera to the ST platform that Mac users take for granted..
>Digital camera a tool for web development...

Well, I always considered a good book on HTML and a text editor tools for
web development. I have yet to see someone trying the digicam method.

[Petey-boy asks for Atari software that doesn't have equivalents on the
Mac and gets the answer "Apex Media"]

>PLease describe what Apex media is

Perhaps you should get some more knowledge of the Atari ST/TT line, it's hardware, OSes, applications, advantages and disadvantages before visiting an .advocacy group. You aren't an anti-Atari advocate, you're a clown.

>You must of not been paying attention to the market. The Mac playform has a
>high share in the Midi market..

When have they hacked MIDI ports into Macs?

[Petey asks for mouse buttons]
>Quite frank, what would the second button's function be?

Under X11, the second and third button will e.g. give you different pop-up menus. On the Atari, holding down the right button and double-clicking the left one will start a program without topping it's window (the path is still set to the topped window).

This is a really wonderful idea, as I'm just as upset to see Atari disappear without comment or popular remembrance.

However, to put this in perspective, the general media has been more or less ignoring Commodore's demise for 2 years now. Interestingly enough, Dateline was the TV program of choice to bombard for Amiga users when they wanted some coverage. Nothing came of it, though.

It's only now that a US company is buying the Amiga back from the German company that wrenched it from Commodore's dead carcass that some occasional coverage is popping up. Sad, but true.

What it comes down to is that when the general populace forsakes something, it remains the responsibility of the userbase to keep the memory alive.

I know that there are many takes on Atari, and while Atari Corp. may no longer exist, there are still many supporters of Atari products.

I grew up with Atari and still remember the "Have You Played Atari Today" jingle. I remember when I first got a Sears VCS (2600) and played it well into the night. I think I had Combat and that game where you shoot stuff that just scrolls by. I really can't remember now. One of my most favorite games of all time was Kaboom! I know it wasn't an Atari game, but it did play on my VCS!

I'm sure everybody has seen the big Atari symbol in Bladerunner. Trouble is, I wonder if the name Atari will even be around when that time comes? Is there a list of Atari appearances in movies or TV shows? It would be interesting just to know.

Anyway, Don Thomas has written two articles that I've reposted here in the hopes that people will read them. It would be nice if the name Atari were kept alive for at least a little while longer. Maybe if somebody notices, maybe if somebody remembers, just maybe...

Dom

P.S. Here is a list of e-mail address that I've compiled:
(I take no credit other than typing them in...)

I don't know about him but personally I PREFER to use Monochrome, it
is much easier on the eye, and WTF do you need colour to do word
processing? If Monochrome is faster and you prefer it then you use it,
it's called 'making the most of what you've got' but having a Mac you
wouldn't understand the concept of maximising efficiency.

>> As far as software I would like to know an alternative to

>Pagestream is comming to the Mac. According to an article and screen shots in
>MacFormat from the UK..

"Only Mac", always playing catchup, we've had Pagestream for years.

>As for CAB, I am sure anything is better. But the ST platform is always paying
>catchup and not being the first with new innovation. Macs are cheap and will
>be even cheaper as the weeks go by. With all these internet related apps and
>the cheap hardware I can find hardly a case for the ST platform..

I almost agree, I would never recommend an Atari platform unless
peopel wanted to use things like Wordprocessing, Spreadsheets etc and
they had a limited budget but my system has built up over several
years as has the software that I own, I have a finely tuned plaform
that is exactly how I want it, moving platform and having the set of
apps that I currently own in native format would cost a fortune.

>You think that is exclusive on the ST? Ever hear of Macros, Quickkeys and
>Alias? I can put Alias of apps anywere I please...I can put apps in my startup
>sequence if I want..

Just incase you didn't realise you can also put apps in the ST startus
sequence and you have been able to since 1979 IIRC.

No it didn't. TOS does not have pre-emptive multitasking, you have to
buy MagiC for that, and lose some compatibility as a result.

Anyway, you have yet to explain (other than formatting floppies, ffs)
why it is so important? I believe that it is "better" rather than
"essential".

You could also look at the myriad of things missing from TOS (or even
MagiC).

Dunno about 180Mhz, but I upgraded from 040 to 100MHz PPC 601 for �300.
As someone who does a lot of raytracing, the improvement in speed over
the 040 is stunning, and compared to the 16Mhz 030 in the Falcon is

in a different league.   Have you tried running POV on a Falcon?

I think the people who already own an ATARI will remember?, who else is there to tell, who else would care bar ATARI owners? I think the saying is "Preaching to the Converted"

>However, to put this in perspective, the general media has been more or
>less ignoring Commodore's demise for 2 years now. Interestingly enough,

Did Commodore do anymore for your average Amiga owner than ATARI did for the average ATARI owner, ok we can thank each company for making the respective machines, but what else?,
ATARI in effect died, but to be honest I and a lot of other ATARIans didn't notice any difference?,

>Dateline was the TV program of choice to bombard for Amiga users when
>they wanted some coverage. Nothing came of it, though.

This will be in America will it?.....

>It's only now that a US company is buying the Amiga back from the German
>company that wrenched it from Commodore's dead carcass that some
>occasional coverage is popping up. Sad, but true.

Let us say Amiga is resurrected, then what?, what difference will it make to the average Amiga user, If the ATARI name was bought back, and ATARI started to trade again, I am sorry but it wouldn't mean anything to most people, maybe nostalgically?

>What it comes down to is that when the general populace forsakes
>something, it remains the responsibility of the userbase to keep the
>memory alive.

Yes, but only Amiga users will keep Amiga alive and ATARI users will
Keep the ATARI name alive, no one else will bother, it's not a
profitable pass time:(

Theres a loayal band of Spectrum owners out there, keeping the name
alive, how many of us had Spectrums, we moved on, and in effect turned
our backs on the very machines that introduced us to the world of
Computers,

Cheers..............!ynoT

Isn't that because Sparkle does not co-operate? If so, then it's
a fault in the app, not the OS. As I said elsewhere, I would agree with
you that pre-emptive multi-tasking is better, but it's not as important
as many other things.

>Now search ftp for a Mac file called QT2MPEG.sit.hex. Unstuff it.

OK, where's the TOS equivalents of QuickTime? QuickDraw 3D? etc

Beg to differ there...My Atari -still- has hardware features and OS
ease-of-use that is only just now becoming available on other platforms!

Just out of total curiosity...What are you using and does it have a
built-in DSP chip? Built-in MIDI? 4 joystick ports? Built-in Lan?
50 khz/8 channel/16-bit sound? SCSI-II? Hmm...???

     Laugh all you want. Laugh while Apple's initiative at delivering PMT
     dies a quick death. Laugh while Atari has had it since 1993 (longer if
     you count alternate OSes). Laugh while your messiah abandons it's OS
     in favor of another. Laugh while yet another Apple platform becomes
     an orphan.

     The Apple abandonment of MacOS in favor of BeOS is the perfect
     testament to the futility of Appledom.

This is the nineties. Where is their automated information system?
Hell, why didn't they just put their vendor information on the web
like Caldera does? Those Mac webservers must not be all that they're
cracked up to be.

This reference is not useful. Hell, it's downright backwards.

This floppy obsession is getting silly.  What's up with you chaps?
Agreed that dragging to trashcan is not obvious, but if you've done it
once, then you know.  And there is a clear menu item for it.

Considering that I go for weeks on end without even using a floppy, I
don't understand your obsession at all.

If you've followed this thread from its inception, then you'll know that the floppy issue was raised only to make a point about the intuitiveness of the Mac OS...Like you, I haven't used the floppy on my Falcon 030 in days, maybe even weeks...CD-ROM gets used quite a bit though! :)

Sorry for the post Scott. I reacted badly to all the Mac bashing that
seems to be going on around here. I owned an ST and a TT and thought
that they had great hardware. I have never really liked TOS but it
is certainly better than Windows and, IMHO, better than the early
versions of the MacOS. However, I think that it is absurd to compare
an SGI to a Falcon.

So.. don't buy one! Just ignore all of us stupid Atari users who are producing music (or whatever) on our computers, while you produce an endless slew of silly emails on yours. See how easily your problem is solved?

BTW, Macs were overpriced for years, but you still evidently bought one. Why did you buy one over a PC? Probably because YOU LIKED IT!!!

Computers are TOOLS! It's not a religion!! Buy what you want to buy, whatever you will use, and shut up already with your incessant childish whining about what computer is better. THE ONE YOU ARE PRODUCTIVE ON IS BETTER!!! Grow up and get a life.

It's a beautiful world out there, Mr. Sinclair-Day..

How can anyone take you seriously? You are incredibly ignorant about what people actually USE the 1040ST for. The computer is used by platinum-record selling artists, particularly in Europe. Erasure has said they will not use a computer other than Atari because the timing on the MIDI ports of both Mac and PC is always off, ever so slightly, because of the way the OS is written and the MIDI info comes over the serial or parallel ports.

How can you criticize something you know so little about?

Brian,
You are normally very thoughtful in your responses
so it surprised me to see that you think Atari
hardware "sucks." Do you not think, for the
time, STs, TTs and the Falcon were great home
computers? The Lynx and Jaguar were also
impressive hardware. I personally think that
my Macintosh 6214 which frequently crashes
and is a replacement for the first one I had
because it would not work sucks. Now that
Apple is trying to cut costs we are seeing
the same problems Atari had with quality
control.

Try scrolling, eg, the file list in the file selector in 256colour mode.
See that slow scrolling, that odd rainbow effect?

>   vibrant Atari public domain scene
Although I no longer look, when I last did (about a year ago) there
was quite a lot of free stuff and shareware (but very little public
domain; be careful with this term).  But most of it was crap.  And
since when was NVDI free?

Believe me, there is no clock-doubling far and wide in Motorola processors. Yes, the external hardware has to supply two different clock frequencies to the processor chip, read closely: they are fed to the chip from the outside, so no internal clock-doubling at all. I don't know the actual names of these signals by heart, but let me put it this way: There is the "main" frequency which determines the speed of internal computing, and then there's a second frequency, doubly as high as the main one, which signal only serves for synchronization purposes. So normally you publish and use that lower, "main" frequency. Apple wants to achieve some marketing effect and uses the higher, meaningless frequency. Yes, it's there, but it's not the real thing, and it's no internal clock-doubling.

I will admit that graphics on the Atari Falcon were a little
slow. With NVDI they were acceptable. NVDI is well worth
the price. It is not like the Falcon is unusable without
it either. I used mine for over a year with no imrpovements
and was very happy with it. For word processing I would
switch to monochrome.
As far as software I would like to know an alternative to
Pagestream on the Atari for the Macintosh in the same
price range. I doubt there is one. I have found that
finding old versions of software for the Macintosh
is difficult. Sources for used software on the Atari
seem to be everywhere. I personally like Atari Works
as well and it may lack many features that Claris Works has but it
is easier to use, is very fast, and solid.
Photoshop is probably more powerful than similar programs on
the Atari. However, there are many choices on the Atari side,
they are cheaper, and they are probably much faster.
Having used Atari software for a few years and swithced to
a Macintosh I am not impressed with the offerings except
for those for the Internet. Even here Atari software is improving
and there is now an alternative to CAB.
I made a comment in my first post about the Atari allowing
a user more control. Some examples are assigning programs
to a key to launch, choosing a preference location
for individual programs, setting file masks, moving and renaming
files, and being able to eject a floppy.
Just some additional thoughts.

>Try scrolling, eg, the file list in the file selector in 256colour mode.
>See that slow scrolling, that odd rainbow effect?

Like most Atarians, I switched over to a different file selector long ago...I use Selectric (and am thinking about trying Freedom-have you seen it? Looks simply smashing) and it scrolls AT speed...and I've always run in 256 color mode... :)

>>   vibrant Atari public domain scene
>Although I no longer look, when I last did (about a year ago) there
>was quite a lot of free stuff and shareware (but very little public
>domain; be careful with this term). But most of it was crap. And
>since when was NVDI free?

Since when did I ever say that NVDI was free? Shareware, Freeware, Postcard ware, Chocolate ware (yea Dan Wilga!), public domain, or whatever you wan to call it--has produced some of the finest software on Atari computers. I salute these programmers extraordinaire!

It's not the same as before as it has differences. That sounds quite a
bit like change to me.

>> Like dragging the floppy icon to the trash can to eject the disk! Ooooh,
>> anybody would have guessed that one its so intuitive! :)
>
>Thats difficult? Just you..

Difficult and intuitive are very different, that isn't intuitive.

>>>Mac users have the option to develop on the web, while Atari users do not have

>
>Yes, but we do it better with apps like HomePage and PageMill. No need to use
>an ASCII editor, when one just has to plop in text, graphics, photos, video and
>sound with ease. Now get back to me when you can hook up a digital camera to
>the ST.

That wasn't the original point, we most certainly do have the option
to develop web pages. I use a macro system to develop my web pages and
it's just as good as most software for at least the majority of
functions, all web software really does it insets a few text strings
into documents either by ising the mouse which slows everythign down
or by using keyboard shortcuts so I just use macros, it's quite
simple, if you have these far superior WP's then why don't you make
the most of them before getting more software? I personally (and I
would assume most people) have no way to justify the cost of a digital
camera, if I want a few pictures on my machine I'll just get them
plopped onto a Photo_CD and load 'em up, quite a bit cheaper than even
a cheap digital camera and the quality is much better too.

>>   Pick up any Mac Warehouse mag, and read the prices for software, then

>>   superior at either function!
>
>Just like the ST, only Atari.

Again you make that stupid statement, the person just said that Macs
are in use as doorstops, you agreed and said that STs were too and in
the same sentence say "only Atari", nice logic, both are doorstops but
only the ST is a dorrstop, hmmmm.

>Open an issue of Keyboard magazine and see what
>platform is reviewed the most..

Open Atari Compuing and see what machine is reviewed most.

>>>ST's don't have PPC!
>>
>>   AND Macs don't have Apex Media, DSP chips as standard, etc, etc,...
>
>PPC processors have rendered DSP obsolete..

Pity they don't render as well as one...

>>>> 10.The single button mouse on Mac does become limited after a while,
>>>>   especially as more and more Atari software uses both buttons now...
>>>Two buttons are here as well..
>>   Is that as standard or do you have to request it? :)
>Request it like you have to request options on the ST..
Never had to request two buttons for my ST mouse, I don't remember
having to request a keyboard either or pay extra for it...

This part below is called a signature, using your "superior" software
(which I assume supports cut and paste) you cut these from the
original posting when replying to postings, it's quite easy if you
have an intuitive system.

Actually guys, the best reason to use an Atari versus a Mac is whether you like the philosophy behind which the computer was designed. Every computer that has ever been designed has retained the "personality" of the first incarnation of that platform. And of course, later models of the platforms merely added to that quality. I don't much like PC compatibles because they were originally boring, stiff, business machines. And now we have the new PC's, which act like the same old (albeit faster and improved) PC, wearing a new set of clothes. I think I'm right with this, aren't I?

:
: Ya, I seen this and knew he was in trouble with this statement.

Not for earlier 68k macs. The LC3 I have tried to use was unable to talk
at over 57600 despite Z-term allowing the user to choose 230400 baud. On

asking mac retailers why >57600 wasn't working, they replied that earlier
68k macs were not up to such speeds...

So my comments are really those of people who sell macs...

Were you one of the ones that slated the Mac selector?!
Anyway, I only used the selector as an easy way to see something scrolling.

>has produced some of the finest software on Atari computers.

That's not saying much, is it?! The main free s/w I used was stuff
ported from other platforms (GNU stuff, POV etc).

How about giving us some examples? You surely aren't going
to try to tell me that GemView is up to the quality of GraphicConverter?

Nope, I've never discussed the Mac selector...

I still have doubts about that statement. I'm using a standard Falcon
with 4 megs/810 meg hard drive at 640 x 480 with 256 colors and no
NVDI and I don't see any problem with scrolling anywhere...

>>has produced some of the finest software on Atari computers.

>That's not saying much, is it?! The main free s/w I used was stuff

Its saying a whole lot...You've obviously not been very exposed to
the sharware/freeware scene...you should look around it a bit before
slagging it...

>How about giving us some examples? You surely aren't going
>to try to tell me that GemView is up to the quality of GraphicConverter?

I can't and won't comment on GraphicConverter because I've never used
it...GemView is an outstanding program though. Along with CAB/STik,
Oasis, Freedom, the Apex Media viewers, ST Zip, POV (as you mentioned),
CD-Player, Edith, and hundreds of others...(these just come to mind
right off the top of my head)

YOU need to get a better grasp of english. YOU also need to get
a better grasp of history.

It would seem that the America's educational difficulties are
inherited.

BTW, you are more than welcome to address where my understanding
of GEM API implementations are faulty. I don't have much confidence
in this ever occuring, however.

Dr. Peter Kittel writes:

: Believe me, there is no clock-doubling far and wide in Motorola
: processors. Yes, the external hardware has to supply two different
: clock frequencies to the processor chip, read closely: they are
: fed to the chip from the outside, so no internal clock-doubling
: at all. I don't know the actual names of these signals by heart,
: but let me put it this way: There is the "main" frequency which
: determines the speed of internal computing, and then there's a
: second frequency, doubly as high as the main one, which signal
: only serves for synchronization purposes. So normally you publish
: and use that lower, "main" frequency. Apple wants to achieve some
: marketing effect and uses the higher, meaningless frequency. Yes,
: it's there, but it's not the real thing, and it's no internal
: clock-doubling.

This is all and well but essentially what you describe
is old news, we sorted _this_ rumour out years ago.
The 040s FPU _does_ however run clockdoubled, albeit with
the same dutycycle as the bus-clock.
Cheers...

>
>So what is this $50 PC title?

I can no longer find the mag with this title as PC mags are out of
date as soon as they are printed so I tend to bin them after reading
them. However a recent issue of PC Format has a password protection
utility for your machine at 31 UKP, an ESP tester at $35, a screen
grabber for 20 UKP admitedly not quite as bad value as this disk util
but hardly good value for money. I can't imagine the ST versions of
any of those getting above 10 UKP and more likely around 5.

>He was using a low feature and functionality app compared to a high featured
>one. I made a point that ClarisWorks loads up faster than MS Office...

Let's be honest here, you assume it to be a low feature app, I doubt
that it is quite as feature packed as Photoshop but I feel that you
are underestimating it's abilities.

>> Mostly with less (mostly useless) features but rarely reduced

>Yep...Our lowend WP, Clarisworks does more costs less..

How much cheaper is Clarisworks than That's Write 3?

Depends on how you look at it. The C-Lab machines are designed for audio recording
and as such are competitive in that market and do=
 rather well. These machines can record 8 tracks of audio simultaneously from
either 8 analogue or digital sources.

How much for a Mac that can do that?

The RAM upgrade is overpriced, we sell them for 200.00 Cdn.

HACK is no mere throw-away term. It has quite a bit of baggage attached to it. That you claim that it was mere carelessness on you part appears to be more a lame excuse to cover up your apparent lack of understanding of the MC68000 architecture and GEM.

>to fix your news software, you'll have to go without that particular
>piece of wisdom!

There's nothing wrong with any of my newreaders. Anonymity in these parts usually requires intent and adeptness. Your captivation with my willfullness and the use of the existence of that characteristic in me as an excuse to trvialize my ideas only shows in you the cowardice you would gleefully declare of me.

Your failure to back up your NVDI assertion remains that: failure.

Subject: BIG news!

BIG news!
By Donald A. Thomas, Jr.

The election is coming up. That seems to be important. It's big news each night on radio and television lately. When I think hard about it, I am not sure why. Many people feel, as do I, that politicians say what they have to in order to be elected. Who knows what they'll really do in office. Even if I gloss over that admittedly defeatist viewpoint, there remains another popular viewpoint that the election is already decided... at least this year anyway.

I suppose it's tradition. We all have to talk about it and hear about it just because it's America's ultimate soap opera. After all, obvious slam dunk elections have turned up as big misses at the polls in the past. It could happen again. As for me, I'd just love to see an innovative game company develop a program that pitched famous politicians against each other. Since the early days, when Activision released their blocky "Boxing" game in 1980, one-against-one bouts have been a popular video game subject. I'd love to see Clinton and Dole go at it in a video game. Perot makes a great on-deck challenger too! I suppose they'd have to V-Chip the game and gray out any blood scenes. I should run for President. I'd love to be in that game to throw some punches. Hey, everyone, write me in! <g>

"Turning Point", a popular television news magazine, featured an in-depth life-after-death segment the other night. Do you suppose there's a coincidence that Halloween is around the corner? Nah, they wouldn't be that corny, would they? The only explanation is that it must be big news. Personally, the entire concept seems to me to be more philosophical than newsworthy. If it wasn't for my family tying up the television, I would have preferred to play "Crypts of Chaos" (20th Century Fox, 1982), "Demon Attack" (Imagic, 1982), "Entombed" (USgames, 1982), "Frankenstein's Monster" (Data Age, 1983), "Ghostbusters" (Activision, 1984), "Ghost Manor" (Xonox, 1983) or "Haunted House" (Atari, 1981). Although none of those equal the notoriety earned by the likes of "Asteroids" (Atari, 1981) or "Missile Command" (Atari, 1980), they were all fun, share a spooky theme and helped wear the metal contacts thin on my Atari 2600 cartridge port.

So the world is changing. No one cares if our President ever inhaled and schools turn in six year olds for kissing classmates to show affection. (Just imagine the outcry if "Custer's Revenge" (Mystique, 1982) was released in today's climate.) Sports games are hot news to gamers, but the mainstream press never mentions them. There's not enough room in the newspaper after you cover the more important non-sports news, you know what I mean, don't you?, the strikes, the spitting, the car crashes while boozed up. I think there's more real game action at Little League. For me, a good game of "Real Sports Baseball" (Atari, 1982) or "Bowling" (Atari, 1978) gives me all the virtual sports action I ever needed and the players never wind up being arrested.

Yes, the world is changing. "PacMan" peaked when he made the cover of "Time Magazine" in the October 25, 1982 issue.

They don't still sell Ralston's "Donkey Kong" cereal (1982) any more, right? I don't know. I stopped helping to pick cereal when I stopped seeing those cool video game promotions on the backs of packages each month. Yea, I see them sometimes now for a complete PlayStation system or a Big Screen TV, but it's not the same. They used to give away trips to Atari Headquarters and full size arcade games. I still have a couple dozen of the scratch off cards handed out at McDonald's restaurants in 1982 based on popular video games. Why don't they do things like that anymore?

It was April 1976, when Atari first released the coin-op version of "Breakout". I remember sharing time with a friend at a convenience store well past midnight on one of those machines. Through the cigarette-stained glass and our own smoke filled eyes, we would stare at colored "bricks" and bouncing pixels for hours on end, driving the four-cornered ball past the front rows of bricks and into a wild frenzy against the back rows through a corridor at one side of the screen or another.

Back then, things were different. No one heard of Aids and teenagers were afraid of being caught at something rather than catching something.

I wish I kept the old newspaper clippings I saved back then. I one day threw them away because it was clear to me then that video games and home computers were front-page topics forever. I never had enough room to store all that paper. There were great video game magazines then just as there are now too. Back then, though, even "Playboy" and "Popular Science" talked about the new form of adult toys that integrated sizzling visuals, tantalizing sounds and responsive joysticks into one heck of a good time. Do they still cover those topics anymore?

So who is buying these great new video games in stores today? Do none of these people watch television or read newspapers? Why is it that the video game industry is so huge, but new product releases and great top-notch programmers hardly ever rate in the entertainment sections? Where is Warren Robinett lately? Who's he dating? Is he married? Children? Why isn't he ever in the celebrity round-up section of USA Today? (Please don't tell me you don't know who he is. You'll really make me sob.)

By the way, one of the institutional founders of the gaming industry proverbially died a few weeks ago. JTS, a disk drive company, absorbed all of Atari Corporation's assets and pretty much soaked it all up with few traces of the monolith that once stood. Ever see the witch melt in Wizard of Oz? Kind of the same thing, except muted.

No big deal though. After all, Atari's final fall is not nearly as big news as predetermined elections, kissing babies, spitting athletes and Halloween stories of an afterlife. Is it?

Subject: Did you say "Goodbye"?

Did you hear anyone say "Goodbye"?

by Donald A. Thomas, Jr. (10/4/96)

It's odd to imagine an institution, which was as big and as powerful as Atari once was, to have been shut down in recent days. The real amazement for me is that it was all accomplished without a measurable flinch from within or outside the gaming industry. I can understand that gamers wanted to push Pong out the door early in the timeline. I can appreciate that the classics such as Missile Command and Asteroids do not push 32-bit and 64-bit systems to any technological limits. I know all these things intellectually, but the heart cannot face the truth that the world and the corporate machine known as Atari could not find an amicable way to coexist.

On Tuesday, July 30, 1996, Atari Corporation took each and every share of it's company (ATC), wrapped them all in a tight bundle and presented them to JTS Corporation; a maker and distributor of hard disk drives. On Wednesday, the shares were traded under the symbol of JTS. Within a few weeks, the remaining staff of Atari that were not dismissed or did not resign, moved to JTS' headquarters in San Jose, California. The three people were assigned to different areas of the building and all that really remains of the Atari namesake is a Santa Clara warehouse full of unsold Jaguar and Lynx products.

It was only as long ago as mid '95 that Atari executives and staff believed things were finally taking a better turn. Wal*Mart had agreed to place Jaguar game systems in 400 of their Superstores across the country. Largely based on this promise of new hope and the opportunities that open when such deals are made, Atari invested heavily in the product and mechanisms required to serve the Wal*Mart chain. But the philosophical beliefs of the Atari decision makers that great products never need advertising or promotions, put the Wal*Mart deal straight into a tailspin. With money tied up in the product on shelves as well as the costs to distribute them to get there, not much was left to saturate any marketplace with advertising. While parents rushed into stores to get their kids Saturns or PlayStations, the few that picked up the Jaguar were chastised by disappointed children on Christmas day.

In an effort to salvage the pending Wal*Mart situation, desperate attempts to run infomercials across the country were activated. The programs were professionally produced by experts in the infomercial industry and designed to permit Atari to run slightly different offers in different markets. In spite of the relatively low cost of running infomercials, the cost to produce them and support them is very high. The results were disappointing. Of the few thousand people who actually placed orders, many of them returned their purchases after the Holidays. The kids wanted what they saw on TV during the day! They wanted what their friends had! They wanted what the magazines were raving about!

In early 1996, Wal*Mart began returning all remaining inventory of Jaguar products. After reversing an "advertising allowance" Atari was obligated to accept, the net benefit Atari realized was an overflowing warehouse of inventory in semi-crushed boxes and with firmly affixed price and security tags. Unable to find a retailer willing to help distribute the numbers required to stay afloat, Atari virtually discontinued operations and traded any remaining cash to JTS in exchange for a graceful way to exit the industry's back door.

Now that JTS has "absorbed" Atari, it really doesn't know what to do with the bulk of machines Atari hoped to sell. It's difficult to liquidate them. Even at liquidation prices, consumers expect a minimal level of support which JTS has no means to offer. The hundreds of calls they receive from consumers that track them down each week are answered to the best ability of one person. Inquiries with regard to licensing Atari classic favorites for other applications such as handheld games are handled by Mr. John Skruch who was with Atari for over 13 years.

In spite of Nintendo's claim that their newest game system is the first 64-bit game system on the market, Atari Corporation actually introduced the first 64-bit system just before Christmas in 1993. Since Atari couldn't afford to launch the system nationwide, the system was introduced in the New York and San Francisco markets first. Beating the 32-bit systems to the punch (Saturn/PlayStation), Atari enjoyed moderate success with the Jaguar system and managed to lure shallow promises from third-party companies to support the system. Unfortunately, programmers grossly underestimated the time required to develop 64-bit games. The jump from 8-bit and 16-bit was wider than anticipated. In addition, Atari was already spread thin monetarily, but were required to finance almost every title that was in development.

After the initial launch, it took Atari almost a year before an assortment of games began to hit store shelves. Even then, having missed the '94 Holiday Season, many of the planned titles were de-accelerated to minimize problems caused by rushing things too fast. Consumers were not happy and retailers were equally dismayed. The few ads that Atari was able to place in magazines were often stating incorrect release dates because that information changed almost every day although magazines deadline their issues up to 120 days in advance.

It was in 1983 that Warner Communications handed Jack Tramiel the reins of Atari. By this time, Atari was often categorized as a household name, but few households wanted to spend much money on new software and the systems were lasting forever. No one needed to buy new ones. That, combined with Warner's obscene spending, amounted to a *daily loss* of over $2 million. Atari was physically spread all over the Silicon Valley with personnel and equipment in literally 80 separate buildings; not considering international offices and manufacturing facilities. Mr. Tramiel took only the home consumer branch of Atari and forced Warner to deal with the arcade division separately. Within a few years, Jack took the company public, introduced an innovative new line of affordable 16-bit computers and released the 7800 video game system.

To accomplish these miracles for Atari, Jack implemented his "business is war" policies. While people who publicly quoted his statement often felt that policy meant being extremely aggressive in the marketplace, the meaning actually had closer ties to Tramiel's experience as a concentration camp survivor. Of the 80 buildings in Sunnyvale, Santa Clara and Milpitas, almost every one of them were amputated from Atari's body of liabilities. The people, the work, the heritage, the history were fired or liquidated. Those who survived were unsympathetically required to fill in the gaps and while most tried, few actually found a way to be successfully do what a dozen people before them did. Atop the mountain, Jack pressed with an iron thumb. All Fed/Ex mailings were required to be pre-approved by one of a handful of people. "Unsigned" purchase orders went unpaid regardless of the urgencies that inspired their creation. Employees found themselves spending valuable time trying to find ways around the system to accomplish their jobs. Many of them lost their jobs for bending the rules or never finding a way to make things work. As horrible as it all sounds, it actually was the only way to protect Atari as a company and give it a chance to survive, as it did and did very well.

Jack's introduction of the 16-bit computer was initially hearty in the United States but it went extremely well in Europe. Europeans were not accustomed to "affordable" technology and although the Atari computers were not IBM compatible, it didn't matter because people could afford them. Jacks' private laugh was that the computers were sold at prices much higher in Europe than Americans were willing to pay. As a result, most of the machines made were being shipped to European destinations to capture the higher margin. This enraged the people in the United States that had been Atari loyalists. While waiting months for stores to take delivery domestically, international magazines were touting ample supplies. Those in the know within the U.S. became dismayed. The remainder never knew Atari was slowly abandoning the value of Atari's name recognition as it became easier and easier to forget, some assuming Atari had long filed for bankruptcy.

On a technical level, Atari 16-bit computers were designed beyond their time. For less than $1,000, consumers could enjoy "multimedia" before the phrase was ever really widely used. The icon-based working environment proceeded Windows popularity although the essential attributes of the two environments were very similar. MIDI was built-in and became an instant hit in the high-end music industry. Tasks were activated and manipulated with a mouse and the system accepted industry standard peripherals such as printers, modems and diskettes.

With all the genius that went into the technology of the machines, very little of equivalent genius went into the promoting and marketing the machines. Mr. Tramiel was the founder of Commodore Business Machines. When he introduced the PET computer in 1977, Jack discovered he didn't have to call a single publication. Instead they all flocked to his door demanding an opportunity to see the product. News magazines. Science Journals. Business newsletters. Newspaper reporters. They were all there with microphone, camera and pen in hand. And they kept coming back. Adding a switch, announcing a new 4K application or signing a new retailer were all big stories the press wanted to handle.

Today, a new video game announcement may generate a request from any of the dozens of gaming magazines for a press release, but a lot of costly work has to be done to assure fair or better coverage. Editorial people are literally swamped with technical news. Samples are mailed regularly to their attention. Faxes fly in through the phone lines and e-mail jams up their hard drives. It takes a lot to grab their attention.

While Atari retained hopes to be successful with the Jaguar, Atari's marketing people were fighting established standards in the industry with severe handicaps. Since cartridges (the Jaguar was/is primarily a cartridge-based system) were so expensive, editorial people were required to return them before new ones would be sent. Editorial people like to assign review projects. So finding cartridges they sent out was not always easy to do. Additionally, reviewers often love their work because they get to keep what they write about. Regardless, the few magazines willing to cover Atari products were more often turned away because of a lack of programmable cartridges or any number of other indecisive barriers.
In-store signs and posters were sometimes created, but many retail chains charge premiums to manufacturers that want to display them. Some direct mail campaigns were implemented, but Atari often could not afford to keep those things being advertised on schedule. Therefore, the advertisements were published and distributed, but the product was not available.

Clearly, Jack's experience with the world beating a path to the door of a company making a better mousetrap no longer applied. The world had revolved a few times beneath him and he never noticed. The tactics used to successfully sell Commodore computers were simply antiquated notions from the past. Meanwhile, Sony launches the PlayStation with over $500 million in marketing funds. Today, the PlayStation is considered the most successful next-generation gaming machine throughout the world. Sony bought the market. Tramiel's Atari never learned how to do that. Actually, they never could afford it anyway.

After the 1990's got underway, Europe as well as the rest of the world, discovered that IBM-compatible computers were becoming more powerful and more affordable. The world always did want computers at home just like in the office and companies like Dell and Gateway exemplified the industry's trend toward home-based office computers. As a result, companies like Commodore, Atari and Next couldn't compete any longer. While the dedicated user base of each of them felt abandoned by these companies having to leave the computer market, the inevitable prevailed. Commodore jumped ship, Next changed business goals completely and Atari invested what they had left in the Jaguar game system. Even today, Apple is kicking and screaming. As good as Apple was at creating a huge niche for themselves, they focused more heavily on education. When kids grow up and get jobs, they want business machines. IBM was always the business standard.

When one examines the history of Atari, an appreciation can grow for how many businesses and people were a part of the game over the years. Chuck E. Cheese Pizza was started by Atari's founder, Mr. Nolan Bushnell. Apple Computer was born in a garage by ex-Atari employees. Activision was founded by Ace Atari programmers. The list goes on and on.

But for some pathetic reason Atari's final days came and went with no tribute, no fanfare and no dignified farewells. Why? Where did all the talent go? Where are all the archives? Where are the vaults? Where are the unpublished games and where are the originals of those that were? Why has no company stepped forward to adopt the remaining attributes Atari has to offer? Where are the creditors? What has happened to all the properties and sites? Where are the databases, warranty cards, promotional items, notes on meetings, unanswered mail? Who owns P.O. Box 61657? Who goes to work in Atari's old offices? Where do consumers have their systems fixed? Who is publishing new games? Who still sells Atari products? Why are there still a lot of people talking about Atari on-line?

I'm an ex-Atari employee and proud to have been. I'm still an Atari devotee and proud to be. To me, these are questions which all deserve an answer, but who will ask them?

The best people to ask these questions are those who have exposure to the public. If you believe Atari left us without saying goodbye, contact Dateline at dateline@nbc.com. If you REALLY believe, then send this article to 10 of your friends in e-mail. AND if YOU REALLY, REALLY believe, mail a few to newspapers or other news programs. A letter in your own words would be great!

I'd spend money for a thorough retrospect on Atari. Wouldn't you?

Wouldn't it at least be nice to say "Goodbye"?

Significant changes?   Looks like small hacks.. If you call these major changes, you are probably right.. These are indeed major changes for TOS..

Still years behind by the other modern OS's

> I -DARE- you to put any 10 novice users in front of a Mac and ask them to
> figure out -on their own!- how to get a floppy disk out!!!! Then you come

Already have.. At one of the local elementary schools, students do it all the time when they need to eject the CD. The Mac platform has already graduated to CD's while a certain one is still in floppy infancy..

> Agreed that there aren't any Web page apps -yet- for the Atari...I've sure

You think it will happen? What would be a lower price? Lower than $99. Why does this platform always play catch up instead of leading for once?

The average comparable ST software that is cheaper is a pipe dream..

> Ditto for the digital camera...

IIRC, the Mac also has DMA sound capability, but this capability is
castrated by the OS.

Does anyone remember Shocker 2, the shareware maze game? My kids are
pleading to continue on to higher levels, but for that you need a code,
available for a fee but the address must be pretty ancient at this point.
Does anyone know if that address is still good, or alternatively, did
anyone pay for it who no longer uses it and would be interested in
selling?
Please e-mail directly, thanks,,,,

Thanks for your message Don. I, too, find it amazing that Atari could not only fall from greatness, but disappear. At one point in the early 80's, Atari was one of the top 5 recognized brands in the U.S. (#2, I think.)

Having worked with (not for) Atari for many years during their peak, I have my own rational as to what happened, and why. It's sad.

-Lee

I was not going to say that, I was just going to explain why I used
the throw-away term "hack". But as you can't be arsed (or are unable)
to fix your news software, you'll have to go without that particular
piece of wisdom!

I am auctioning the following Atari Computer Equipment and Software:

Atari 130XE
Atari 130XE w/ 320k and RamRod OS
Atari 800
Atari 1200XL
Black Box Hard Drive Controller w/ 64k Print Spooler
Black Box Case
20 Meg Hard Drive
Power Supply for the Hard Drive
Atari 1050 Disk Drive w/ US Double
Atari 810 Disk Drive
Atari 810 Disk Drive (Untested)
Magnavox Amber Monitor
Atari 835 Modem (Untested)
Atari 410 Program Recorder

Koala Pad (Untested)
Microflight Joystick
Various Joysticks, controllers, Power Supplies and Cables

Approximately 390 disks full of software, most double sided

Books:
Your Atari Comes Alive
Tricky Tutorial Series
Your Atari Computer
Mapping the Atari
Electronic Computer Projects
Atari Roots
De Re Atari
Atari Technical Manuals

Visit the Auction site at: http://www.ebay.com/aw/item.cgi?item=ybi025010

They would have been major changes on any OS...and ease of use with TOS
has yet to be matched by any other OS...

>Already have.. At one of the local elementary schools, students do it all the
>time when they need to eject the CD. The Mac platform has already graduated to

>CD's while a certain one is still in floppy infancy..

You're telling me that at a local elementary school, with no prompting from anyone else, that the kids just "KNEW" to drag the floppy disk icon to the trash can, to eject the disk? (remember I said novices here, with no prior Mac experience!!!) The Mac was forced to move over to CD's just like the PC market due to ineffecient coding and software "bloat"... :)

>You think it will happen? What would be a lower price? Lower than $99. Why
>does this platform always play catch up instead of leading for once?

Because the people who code for TOS/GEM (for the love of it!) wait to see all the mistakes that are made in a "trend" then taking advantage of TOS's efficiency and ability to use resources without waste, write better versions... :)

>The average comparable ST software that is cheaper is a pipe dream..

I dream with that software every day on my Falcon 030... <smile>

My requests for examples have gone unheeded, unfortunately.

For me, most of my time is spent in applications not "the OS" (I assume
you mean Finder and/or TOS desktop by this; or what else do you mean?)
For apps, one of the most important things is consistency between different
programs, so that it's easier to learn the basics of each different app.
Atari s/w, for various reasons, didn't get that level of consistency.
There's not even agreement on which keys to use for cut and paste.
Or even Open/Load!

> from anyone else, that the kids just "KNEW" to drag the floppy disk icon
> to the trash can, to eject the disk?

That's just one example, and it's a fine one. But why the obsession with
floppies? I guess they're more important to an ST user than someone with
more modern kit. When asked for examples of bad UI, that's all anyone
has come up with. When asked for examples of multi-tasking, all anyone
can talk about is formatting floppies. What's the floppy obsession?

> I dream with that software every day on my Falcon 030... <smile>

Which spreadsheet do you use?

I realize that the original point was that neither early 68k Macs or Early Atari's (before '90/91 or so) could run faster than 19200, but I just wanted to point out how easy it is to make any Atari, even the 520ST (circa '85) run higher serial port speeds...Thanks.

    MacOS would be the LAST system to not yet have fully Pre-emptive
    multi-tasking. It came to TOS quite some time ago (3+ years). MacOS
    may have it... some day. Until then, apple will just keep throwing
    application level toys at it's userbase and attempt to call them a
    part of the OS.

>programs, so that it's easier to learn the basics of each different app.
>Atari s/w, for various reasons, didn't get that level of consistency.
>There's not even agreement on which keys to use for cut and paste.
>Or even Open/Load!

Hmm...most of the Atari software I use, follows very similiar conventions.
For example, [esc] clears the line/field you're in, [tab] will take you

to the next menu item...etc, etc,... I do agree that too many programmers "did it their own way" because they thought they could do it better. You know, sometimes they were right though...I give Douglas Little of Black Scorpion and their outstanding, world class product, Apex Media, which does not use GEM...but is extraordinary, nonetheless...as an example.

>That's just one example, and it's a fine one. But why the obsession with
>floppies? I guess they're more important to an ST user than someone with
>more modern kit. When asked for examples of bad UI, that's all anyone
>has come up with. When asked for examples of multi-tasking, all anyone
>can talk about is formatting floppies. What's the floppy obsession?

I don't think its really a floppy obsession but its an example that shows how well multitasking works because formatting a floppy really ties up most systems resources...I've seen an Amiga format 2 and 3 floppies simultaneously, while other desktop activities were being performed...not much slowdown either! MagiC and Neodesk do this as well, on Atari's...(background)

>Which spreadsheet do you use?

I have LDW Power, a Lotus 1-2-3 compatible...but I've been looking at Twist, a relational database program that looks pretty cool, and as you know, a lot of times, databases and spreadsheets can do the same functions...(have you seen Opus2.2? Looks good as well!) I have Atariworks, and while it can't do every single little thing some of the heavyweights in the Mac/PC world can, it does -most- and its very solid...

Sure, whatever you say.. Hmmm..I wonder if I still have my my collection of
ANALOG and some issues od ST LOG laying around, must be boxed in the attic.
Actually I learn whats new in the weekly rags like MacWeek..

> Ya, that is what he said. For him it was easier to use.
>

Others would disagree..Such as Bruce Webster and my try with the ST. Not as
polished as the Mac.. Depends on one's perception.. However, the industry
states that the Mac is the the most inutive and easier to use.. That is
generaly a fact..

>> > This Mac is a Classic color (68000 CPU, tell me if I'm wrong). It was

> 040 line for a lot less money.

The problem is that the Quadra is no longer available new, so how can you state
is cheaper? However, Performa 6116's can be had for $599, includes a CD-Rom
to boot.

Crippled system in what way? How?

> Let's see, jump over to the Mac newsgroup, jeez, I can't believe the
> types of people a mainstream computer platform brings onto the internet.
> Some of those questions are pretty ignorant.

What ignorant questions? Could it be that these new users are first time buyers/users of a given platform. As I recall, there was ignorant questions about the ST during the early years..

> platform :)

Why 5-10 years? Do you have a crystal ball? Apple hardware is a bargain today...Much cheaper to boot than a Falcon and the Hades..

This semester campus sales will exceed the previous fall one significantly. We have students/staff beating down the door to get a hold of the 6400's. Doing at least one demo(two every other week)has done wonders to my sales..

Directory? I use aliases..No fuss/nor muss...

> Until each new release of MagiC, MiNT, XaAES, oAESes, Geneva, Thing etc...
> comes out...

You mean hacks. As for memory usage, Mac OS and Windows do more and cost less. Considering that machines come with 16 megs, not an issue. I upgraded to 49 megs, and my setup is still cheaper than a Falcon.. Why is the Falcon over priced?

> Yes. _Most_ 68k Macs are limited in this way. Some newer 68k Macs can do
> better (ie. newer Performas, AV macs of course)...

Which exceed the numbers of the ST platform..

> : Please explain?
>
> Does this need explaining? The learning curve on software is MUCH steeper
> on _most_ Mac software I have seen compared to comparable Atari software
> with similar features...

Depends on the software.. I understand that Calmus wasn't a piece of cake to master either. However, apps like ClarisWorks have no equal on the ST platform..

Exactly.. Don't expect WebStar, PageMill, Claris Homepage and many other
internet apps/tools anytime soon on the ST platform. Heck, you can't even hook
up a digital camera to the ST platform that Mac users take for granted..
Digital camera a tool for web development...

> : Prove it?

You must of not been paying attention to the market. The Mac playform has a
high share in the Midi market..

I hear that some of the popular previous titles will no longer be upgraded..

> functional) and sells for less.

You said it...Photoline does not have all the features of Photoshop and you
compare it anyways..

> There are some things that PhotoLine does better than Photoslop and vice
> versa. This is inherent in software packages even packages on the same
> platform exhibit these differences...Illustrator vs. Freehand as one
> example. Live Picture vs. PhotoSlop.

Illustrator and Freehand are about equevelant Photoline is not! Like me
comparing what a speed demon Clarisworks is compared to MS Office. How ever MS
Office does more...

> PhotoLine executes, loads and filters faster.

Yea are thse equevelant?

> PhotoLine run on the same Mac9500 outperforms PhotoSlop by an impressive
> margin, this of course under OS emulation called MagiCMac which brings
> true 32 bit preemptive multitasking to the Mac. Something you won't have
> until the next millenium if Apple still exists by then.

Of course MagiCmac can't use Quicktime, OpenDoc, AppleScripts QuickDraw and
emerging Apple software technology.. Nice try..

Apple will be here longer than your business. Now that Apple is buying Be,
which will incorporate certain elements of the Be OS with System 8, this new OS

will be available by the August MacWorld..

> For me to suggest that the 68060 is architecturally better or even
> remotely close to the architecture of a PPC would be ludicrous and you
> took this out of context. The point is that a 68060 running a compact
> and efficient OS and highly optimized applications is able to outperform
> a PPC running the bloated garbage coming out for it.

The only problem with this asertion is that this soo called compact OS have far less features and functionality that matter in the Mac market.. Nice try.. Hell System 6 if it was optimized for PPC would run rings around System 7 due to its compactness. But System 7 is more of a modern OS with functionality..

> And we sell Macs...

Not doing a good job..)

> The comparison was between TOS running TOS applications on a 68060 and
> MacOS running MacOS applications on a Mac 9500. The time to do a
> specific task on both machines is what we are comparing here. The

> matter, on pretty much any test we can throw at it.

Are you stating that this 68060 box will blow the doors off a 200mhz 604e box..?

How can you make that statement when there are no equevelant apps on the ST market. Like me stating that ClarisWorks will blow the doors off MS Office..

> If there was not so much wasted resources, so much bloat and so much
> disk intensive access going on, this 9500 should outperform a 68060. No
> doubt about that. But, it doesn't because the macOS is slow, hell my
> friends Volkswagen is faster than the MacOS.

Again, you are not comparing equevelant functions and features..

> I asked you to do some benchmarks on a 20MB TIFF and whatever app you
> wanted to use and haven't heard back from you. Having a hard time
> finding a 20MB TIFF and an app that can come close to the speed I
> posted? Whenever you are ready...

How can I? Again there is no equevelancy on the ST platform. Soo benchmarks are irrelevant..

> Chris @ Computer Direct

      ...but that's not what we're comparing...

      Even so, neither one of those machines outclasses the other quite
      in the manner Petey-Boy would imply a PPC outclasses an 060.
      Furthermore, Petey-Boy asserts that an 060 cannot compete with a
      PPC merely because of what it is ignoring the tests that say other-
      wise and offering no reason for us to believe that an 060 wouldn't
```

toast a PPC, especially his. In fact, if the 060 specs on mot's homepage are to believed, the T60 under discussion should be, at a minimum, twice as fast as Petey-Boy's PowerMac.

This is a conservative estimate, presuming that the 060 is just a souped up 040. If that is not the case, then the 060 would be a bit more powerful and quite able to compare to 686's and 604's.

Considering that it's a superscalar cpu with branch caching
and executes 3 instructions per clock, such comparisons are not
at all wild. At the VERY least it should be able to keep up
with a 120Mhz 601 or P5. Eliminate OS overhead inherent in
Mac/PC's the minimal performance of an 060/66 should be quite
a bit better than even that.

It is motorola hardware after all...

Some just know how to use it more efficiently.
Some things never change... '-p

You said that $2800 would be a real bargain with plain DRAM VGA
and that the majority were $4000 and up. You didn't mention the
server. I presume that there are not a plethora for that would
rather defeat the point...

Even so, one can get a server system with a 200Mhz P6, 64 Megs
of RAM, 4 Gig HD and Fast UltraWide SCSI for $3200. This includes
the multimedia baubles. Leave out the Multimedia baubles and it
would still come in at around $2600...

>
>>   Your lab was robbed.
>
>Hardly. We get the stuff at cost. The retail prices are what I mentioned

Oddly enough, they seem to have disappeared. One is hard pressed
to find PC's in your 'average' price range. One is especially
hard pressed to find mere Pentia in that range. All I could find
in that range were SMP P6's. If you really need that much horse
power for your servers, you're looking in the wrong stables.

I really don't know where you're finding these 50K systems.
The most expensive PC I found was $7200, was a Dual 200Mhz P6,
with 128Megs RAM, 9 Gig disk, 21" monitor & 12x CD.

[deletia]
>Which is still not a suitable file server.

   Petey-Boy still doesn't and was bailed out by someone else.
   This rescue does not negate my original criticism of him; it
   re-enforces it. The original comparison was never addressed by
   anything but rhetoric and a few passing comments by someone
   !(an apple cheerleader).

   It just spawned an interesting tangent.

>slightly faster and they performed fewer iterations. Probably the graphics
>resolution and colour depth were different.

Hmm...I can't say with certainty that line for line the code did the
same thing...HOWEVER, the end result was a demo on the Falcon that was
screen identical to the Alpha teams's demo and was faster...and it did
infuriate the Alpha team so much that they asked the show hosts to make
Atari stop displaying the demo...The nerve of that upstart Atari team

   and their Falcon!!!

>The point I'm trying to make is that one can't claim with certainty that
>one machine is faster than the other until we ensure that all variables
>except the hardware are controlled. Otherwise, we can't be sure that the
>differences in performance are due to the hardware rather than the software.

   I've never said that the Falcon was "faster" than a Dec Alpha or Pentium
   or (fill in the blank here please)...The fact I'm trying to get across to
   so many non-Atarians is that TOS/GEM systems running on hardware with
   very nice custom chips (DSP, etc,) far outperforms the specs...(something
   Atarians have known for years)... Thank you...

That wasn't misleading. TOS 3 actually came out before TOS 2.06 IIRC.
Tos 2.06 is TOS 3 without the few extra TT features, TOS 2.06 was an
optional upgrade whereas TOS 3 is only available with machines that
need it.

This is just an example, sure there may have been differences and the
like but the Alpha team obviously didn't seem to notice them. The
point is that it's not raw machine power that counts, it's the quality
of of the coding too. The 601 would surely wipe the floor with
something like the Falcon as far as raw number crunching goes but when
```

you actually start running full on apps, the difference is far less
marked.

Hold on -- are you saying that:

(1) If Motorola calls it the 68060, but it's really not as powerful as a jump from 040 to 060 might suggest, then that's misleading of Motorola

and at the same time that

(2) When Atari jumps from 2.0x to 3.0x it doesn't matter (ie, it's not as misleading) because nobody expected any different?

Doesn't that seem unfair, to hold one company up to a standard you do not hold another company up to?

As for your comments about software being a domain without any engineering to speak of, I would have to disagree. Anyone who works in a serious software/programming operation could tell you that engineering methods are applied to software all the time. In fact, it's called "software engineering."

As for ISO9001, I work for a company that complies with ISO9001, and I can tell you for a fact that ISO9001 has nothing to say about the naming of products and whether or not they are misleading. ISO9001 can be summed up simply as:

(1) Say what you do.
(2) Do what you say.
(3) Document any discrepancies between (1) and (2)
(4) Act on the difference outlined in (3)

Of course, in reality it's really not quite that simple. I hope you're not suggesting that a 68060 that doesn't compare to the P6 could result in Motorola losing ISO certification.
>   Either they compare (060 & P6), or Motorola gets a nice spot beside

The difference between small applications and OpenDoc parts is that the parts can all be embedded in each other, the parts all share the same interface. The parts are designed to work seamlessly with each other, and this is not necessarily the case with "small" applications.

>>OpenDoc-compatible software can work with OLE-compatible software. OpenDoc

If you use OLE or OpenDoc, you don't have to worry about losing information (formatting information, for example, like when you copy from a spreadsheet to a word processor and lose formatting information).

Your statement shows that I haven't been clear. You are not "using the word processor as a demented form of spreadsheet," you are using the spreadsheet part; you just have embedded the part into the word processing document. You don't have to switch to another application, you don't have to worry about a different program with a different interface. And you can embed any kind of data into any other kind of document you want; interoperability is assured.

This is true.  However, according to Motorola's web site, the 68060 is
available in three speeds, the maximum being 66MHz.
(See http://www.mot.com/SPS/HPESD/prod/0X0/68060.html)

> a bit better than even that.

The PowerPC 601 can issue and retire three instructions per clock. That means that a 120MHz 601 can execute 360 MIPS. A 68060 can also execute three instructions per clock. That means that a 66MHz 68060 can execute 198MIPS. The PowerPC 601 has a 32K onboard cache. The 68060 has a 16K onboard cache. In addition, the PowerPC 601 has a 64-bit data bus, in contrast to the 68060's 32-bit data bus. These would all seem to suggest that a 120MHz 601 has an advantage over a 66MHz 68060.

If Motorola could make a 68060 at 66MHz run as fast as a 601 does at 120MHz, wouldn't it stand to reason that they would have put everything that made the 68060 super-fast into the 601? Why would Motorola make the 68060 so much faster with respect to clock speed than the PowerPC?

The PowerPC 604, which was mentioned earlier in this thread, can issue four instructions per clock, which would mean that a 604 at 120MHz can execute 480MIPS. The 604e, the succesor to the 604, has a 64K onboard cache.

> It is motorola hardware after all...

The PowerPC is also Motorola hardware! Earlier you were arguing that the performance of the 68060 would reflect on the PowerPC, since they're both made by the company. If the PowerPC is so inefficient that, at almost twice the clock speed of the 68060, it runs just as fast, wouldn't that also reflect badly on Motorola? If it works one way (68060 -> PPC) then why shouldn't it work the other way? (PPC -> 68060?)

No. For an example of some sites that use QuickTime VR (of course, you'll nead the QuickTime VR plug-in for your browser) go to the following URL: <http://qtvr.quicktime.apple.com/sam/saminet.html>, which contains links to just a few (about four dozen) of the estimated thousands of sites that are QTVR-enhanced.

For another example of a site which uses a lot of cool stuff (including QTVR for a tour of their studio) visit <http://www.bluewaters.com/> Check out Conagious InterActive's QuickTime showcase site for another example of what QUickTime can do. It's at <http://www.contagious.com/qt/>. Also try out <http://www.MediaCity.com/~erweb/>. These are some starting points that have lots of neat QuickTime stuff.

I don't know whether you have access to a PC or Mac running a browser which can handle Netscape Plug-ins. If not, you won't be able to see the neat stuff on those sites.

> I was thinking more of somone like DEC or Siemans or McDonald-Douglas
> or some ministry in thailand or whatnot.

Some of the links include the city of Oxford, U of Texas, U of Philadelphia, the US Space Camp, Toyota, Time Magazine, San Francisco Giants, MCA/Universal Studios, Japan Airlines, Fox Studio, General Electric, Disney, AT&T, and BMW.

> QT. (functionality)

Myst, Havoc, ST:TNG Technical Manual are all examples of excellent games that use QuickTime and its cousins. (As are the sites above, which use QT & QTVR.) As for Cyberstudio, I'm not familiar with it. Does it encompass VR, 3D, music, text, and sound? Even if it does (and I'm not saying it doesn't) it still doesn't have the benefit of being the de facto standard in multimedia presentation and authoring.

>why shouldn't it work the other way? (PPC -> 68060?)

Isn't the PowerPC based on IBM's RIO chipset, except some instructions were left out and it's a single chip CPU now? I know Motorola produces it, and I think they use the memory bus from one of their older RISC series for it, but I always thought it was an IBM made architecture.

```
Am I all wrong about this?

You've engaged in some creative deletion here, which is disingenuous.

In the original message, I said:
```

>QuickTime is not a video file format. QuickTime "movies" can contain
>text, graphics, sound, music, full motion video, VR panoramas, and 3-D
>objects. QuickTime VR is a subset of QuickTime for displaying VR

to which you responded:

>   Then show me an URL where all these nifty toys are used and then
>   tell me who uses them and how.

I replied with the following:

>A good start would be http://quicktime.apple.com/. In there you should be
>able to find a link to the QuickTime FAQ, which should answer any questions
>you have about what QuickTime is and does. The Start Trek TNG Technical
>Manual is an example of an early product that used QuickTime VR. A version
>of Apple's 3D Metafile format has been adopted as an textension of VRML, if
>I'm not mistaken.

but when you replied to that message, you only quoted the first line, and then accused me of not answering your entire question;

>>A good start would be http://quicktime.apple.com/. In there you should be
>
>   Is that really the best you can do? Besides, apple's sites are the
>   absolute slowest sites on the net. They're not useful for anything
>   even assuming they do contain any content. The sloth of apple sites
>   show the genuine uselessness of highbandwidth file formats on the net.
>
>   I was thinking more of somone like DEC or Siemans or McDonald-Douglas
>   or some ministry in thailand or whatnot.
>
>[didn't address my question, got deleted]

Didn't I say that the ST:TNG Technical Manual was an early product that used QTVR, and that Apple's 3D metafile format was adopted as an extension of VRML? Aren't those two examples of what QuickTime and QuickTime VR are being used for? How does this not address your question?

And then, at the bottom of the message, you clip an entire response from me, like this:

>>>[Tangent Deleted]
>>
>[Tangent^2 Deleted]

Why did you clip it when it was a clear response to your challenge to compare Word and ClarisWorks, and not a tangent at all?

```

>>Most of them run, but a bit slower. At least that's what I've heard.

>What on? On an 680x0 Amiga? *chuckle*

There are very few apps which are PowerMac only (more games and the like).
Most come as FAT binary or in two versions.
68k apps ARE nearly as fast as on a PowerMac which must emulate the 68k
processor.

I belive you are quite correct. The PPC bus-implementation is
based on Motorolas own M88000 risc design. I think the chip
itself is based on the RS6000/Power1 design emerging from the
ROMP cpu which pioneered the 801 risc core.

1. Preemptive multitasking
2. The system takes up less than three megs on Atari computers
3. The Atari gives users more control
4. There are numerous cheap alternatives for software
5. One does not have to allocate memory for every app
6. Most everything is faster on the Atari computer
7. Small applications
8. The Atari operating system is more intuitive
9. Separate programs replace resource grabbing extensions
10. The Atari crashes much less frequently

These are some of my observations having bought a Macintosh to
replace my Falcon. I am not saying I hate Macintosh or attacking
it but simply pointing out some advantages of the computer I like
which is rare in this group.

>hold another company up to?

This is the main gist of the ISO9001 standard, actually, as stated
by the auditors themselves.

```
ISO9001: if(crap(today))    crap(tomorrow);
         if(quality(today)) quality(tomorrow);
```

Motorola would be breaking 10 years of product history if they
belong on the wall of shame. That inconsistency is the relevant
part. Furthermore, Atari was already on the wall with Cyrix. I've
been berating them in these parts for various things probably before
you even touched a keyboard. Atarian's no longer naively believe in
the corporation that spawned their machine, unlike some brands of
cheerleader...

>
>As for your comments about software being a domain without any engineering
>to speak of, I would have to disagree. Anyone who works in a serious

These are rather feeble attempts by some in the industry to avoid
the uncomfortable realization that computing is an immature discipline.
To presume to compare what gets passed off as software engineering
as something remotely equivalent to any other form of engineering
shows a fundemental misunderstanding of those disciplines. It also
grievously insults them at the same time. It also contradicts reality
and is especially laughable to those of us in the quality field.
We know better.

>
>>   Either they compare (060 & P6), or Motorola gets a nice spot beside

Yes, but I can do that already and I don't even need an interoperability standard beyond a win style clipboard. You've not yet described anything that I have not yet been able to do perfectly well without an interop uber-api.

The same applies to cyberdog. It has not yet been shown to be worth our while.

>(See http://www.mot.com/SPS/HPESD/prod/0X0/68060.html)

    Precisely. This makes it the approximate of a 198Mhz 68040.
    Presuming that 040 & 486 performance are roughly equal, this
    makes it the equivalent of a 200Mhz 486 or a 125Mhz Pentium.
    125Mhz Pentium although rather slow by current bleeding edge
    standards is more than fast enough to toast quite a few PowerMacs
    including the one Petey-Boy owns. And this is just the lowerbound
    estimate...

It is, however, consistent with what observations can actually be provided. If you can provide some comparative SPECmarks or some empirical comparisons, knock yourself out.

This whole melee got started when some Mac Cheerleader couldn't countenance the possibility of an 060 TT clone outrunning powermacs on certain graphics intensive operations.

Perhaps the PowerMacs are just sucking cpu cycles into some tiny onboard Black Hole and the T60's feats are less a tribute to it than testimony against Macs.

The Mac/PC crowd doing less with more... nah... '-p

The PowerPC 601 was derived from IBM's POWER Architecture, used in its
RS/6000 series.  Motorola, Apple, and IBM all worked on the PowerPC.

I have no naieve attachment to Apple. If someone manufactures a better computer, I'll buy it. I just believe that, for my needs and wants, Apple makes the best machine for me. (I'm not here to deride anyone for the machine they use, nor do I wish to convert anyone. If you want to use an Atari, fine.)

Pete is the group? Talk about how minds work!
For Peter to be an acceptable part of this group
he would have to change his format more that just
slighty.

1. Before making any negitive statement or comment concerning Atari products, available software or third party hardware or clones he needs to have first hand experience with the item he is discussing (or flaming). I think this limits his experience to a 1040ST, probably with TOS 1.02 if memory serves me correctly. He has no understanding of current applications, Falcon specific hardware or software, or available clones. Any statement he makes concerning the above hardware is

strictly his own imagination at work. It can not even be considered hear-say or opinion.

2. Most all that get involved in his (crap) posting have experience on both Macs and PC platforms. I can personally say that any of his statements concerning the Apple platform are available to all just by reading MacWorld or the like. I find nothing he post to be of a ground breaking nature, but then I am employed where there are over 8,000 Apple units in use, so Apple products are nothing new to me. I find very little exciting about their products, and have "first hand" experience on the plus and minus of most of their product line.

3. He needs to stop being such a whine baby shit head. This shows in his quoting of a whole post just to add his meanless two or three word response.

Mike

I have been reading this group for a few days. I hoped that we could all debate in here without resorting to such tactics as ad hominem attacks, and creative snipping. Unfortunately, it seems that I assumed incorrectly.

It appears that every time I address one of your points, you delete my reponse from your reply. Why is it so difficult for you to admit that I've answered your questions and responded to your requests for more information? You quote answers you don't like and give snappy comebacks, and delete entirely answers that meet your challenges. I would think that you would have the intellectual honesty to admit when you are incorrect.

Never mind; you can go back to bashing Peter Sinclair-Day, and to believing whathever you want to believe about OpenDoc, the Motorola 68060, and QuickTime, no matter how true or untrue it is. I will not respond directly to postings on this group any more. (If you want, we could continue the debate in e-mail, but unfortunately you don't like signing your posts with any e-mail address. Perhaps that should have told me something.)

So which is it? Is it free, or is it $350 per year? Keep in mind that many
Atari users haven't spent $350 for their whole computer system, so that much
per year is a HUGE investment.

     Most of Myst looks like a cross between DungeonMaster and Spectrum512.
     In fact, given enough storage, most of Myst should be doable on an
     ST in this fashion. It is a rather poor example actually...

What part do you not understand. There was a claim that Photolite is
equevelant to Photoshop.

What version is being used...A simple question..

To the end user, open doc and cyberdog is free. I recieved mine from the enclosed Mac Addict CD.. However, if you are a open doc developer a membership for professional support and tools is going to cost $....

That explains Atari's demise. There developers were too CHEAP!

>So where are the multitasking apps?

You don't need multitasking apps if the system is pre-emptive.
EVERYTHING becomes multitasking. This isn't that co-operative shite.

>
>> 2. The system takes up less than three megs on Atari computers
>
>So? I have 49 megs ram and still paid under $1000....Much cheaper to boot!

Still extra cost no matter how cheap.
>
>> 4. There are numerous cheap alternatives for software
>
>Same here...My system came with over $500 in free apps.

I think they mean PD software, there is more freeware on the Atari and
Shareware tends to be much cheaper than the PC (not sure about mac
shareware prices).

>> 5. One does not have to allocate memory for every app
>
>So...

Well you don't have to allocate it, it saves time and lets the Apps
use what they need as they need it.

>> 6. Most everything is faster on the Atari computer
>Whats most everything? Try running Marathon on the ST...

I have no idea what that is but the power:performance ratio for the
atari machines is much better than for the Mac even if the total speed
isn't.

>> 7. Small applications
>We have those too! We also have big bloaty ones as well..

An app on an Atari doing exactly the same as a Mac app is likely to be
quite a bit smaller. Atari apps need to be more compact and efficient
so people try, rather than know that people will get a faster
processor if they want more speed. This means that a high power Atari
machine flies along and is a luxury rather than a necessity.

>> 8. The Atari operating system is more intuitive
>I beg to differ.. So were is publish/subscribe, opendoc, cyberdog, quickdraw
>3d and so on?

That has little to do with intuitivity. I have no idea which is more
intuitive, it will vary from person to person.

```
>> 9.  Separate programs replace resource grabbing extensions
>Huh...Just turn mine off when not needed...  No fuss, nor muss..

Nah didn't even understand the original point to be honest.

>> 10. The Atari crashes much less frequently

Almost as simple as me making the point that I never claimed that I
use Photoshop.

You have control over the applications rather than them taking control
of your machine. If I have a raytrace running, I tell it exactly how
much of the processor time it can have and if I have a bit spare
anyway then it gets given it. I've switched pre-emptive multitasking
off to see what it was like and although usable it wan't nice.

I've never had the problems that you mentioned, it's not AFAIK wired
incorrectly but simply utilises un-used pins on the Out port, if you
use cheap cables with pins wired together then yeah you might get
problems. So what if you think keyboard/mouse handling may cause an
overrun, Macs don't even have any MIDI ports to overrun!

The 68040 is not clock doubled.

```
The 68060 is neither clock quadrupled nor clock doubled.
(At least not in the way that instructions are executed with a faster clock
speed than the external one. Both CPUs use the external clock speed to execute
instructions.)
Check out the comp.sys.m68k FAQ for details.

Using the internal clock in marketing is no hype if instructions are actually
executed using that clock speed, as is the case with x86-CPUs.

 In every day use ways...we have a Mac at work,...I've used it on and
 off over the last few years...in no way, shape, form or function is
 it easier or even as easy to use as my Falcon...Maybe this is a
 totally subjective thing, and I don't have a million dollar research
 group looking it over, but its my opinion and I will not change it,
 no matter how much wind blows or Mr. Sinclap inhales... :)

>>  Hmm...do you think he might have actually meant 68000 Macs?

 They are not irrelevant, if that was what he meant...

>>  Its faster, more effecient, just plain better...
>There you go again, nothing concrete (except "faster"; but pre-emptiveness
>does not in itself make anything faster at all).

 Wrong...pre-emptive multitasking systems are recognized the world over
 (except in Mac circles-grin!) as being superior to co-operative systems.
 Try formatting a disk, and at the same time opening Photoshop...<heh>

>>  Funny how an awful lot of very professional, and powerful software
>>  got written for it anyways, isn't it? :)
>But all pro s/w now is for PC and Mac...

 Wrong, wrong, wrong...Cubase Audio, Calamus SL, Papyrus, Apex Media (and
 soon Apex Audio) etc, etc, etc,...(tired of typing) :)

>>  AND how fast does you DSP chip run on your Performa?   <heh>
>Doesn't need one, I put a PPC in it!

 Then you don't know what you are missing, do you??? <smile>

BUT 68000 Atari machines are still considered -very- functional...

You're right in one respect though, lets compare the PowerMac against
a 68060 equipped Hades or DirecT running similar apps... <grin> I know
I'll take TOS's functionality anytime, anywhere... %^)

So 49 meg is cheaper than 4 or 14? A memory test doesn't take longer,
prove it.

>>>> 7. Small applications

>Why?

Because you are trying to sell the Mac to us and are entirely
unconvincing. If you meant why are you like this then perhaps you
should ask someone with a big couch and lots and lots of time.

An intense task I'm sure, a program with lots of buttons that are just
shortcuts for short text strings. Hardly high power work is it. Oh and
playing some of those video things you love but then I don't recall my
VCR ever crashing either.

About as logical as any of your other thoughts, and no I can't prove
it before you ask.

You can feel it? Do you need an interactive glove or something? Or
just plug the Mac into your basic head mounted brainwave generator?

Yeah we have a huge catalogue of games, what about you or has Aplle
only just realised that there is a games market. Personally I have
never even considered running a game and other stuff at the other time
but I'm sure some stuff would work.

>>>So? I have 49 megs ram and still paid under $1000....Much cheaper to boot!

>> Still extra cost no matter how cheap.
>
>True, not cost prohibitive. To do any serious work on the Falcon required 14
>megs. Atari did sell a 14 meg version. I use many low memory apps. I still
>use a Microphone version dating back to 1992..

It depends what you mean to be productive, you could easily write a
novel or something on an old 286 or ST or Amiga or Mac or PC
whatever you don't need lots of space for productivity like that
although 4 meg+ is obviously recomended.

>Now, that I am starting web development(a pipe dream on the ST), the ram will
>come in handy..

>Really... Have you ever heard of Bmug and Educorp, the premier distributors
>PDS stuff?
>
>Prove that the ST shareware is cheaper? Compare equivelant shareware..

From the PC stuff that I've seen in magazines, some people seem to
have the idea that $50 is ok for a shite disk util, I did take a quick
look through some MAc mags that I had and yes software was actually
very cheap for the Mac but I never commented on Mac prices before.

>> Well you don't have to allocate it, it saves time and lets the Apps

>
>Are you inhaling funny stuff? Prove it that the power/performance ratio is
>better.

It's far more trouble than it is worth to be honest just to prove a
point, how do you want me to measure chip power? What tests do you
want me to do? Whatever I try you'll only give me the usual compare
Photoshop shite, someone stated some tests before but you responded
with "your mac must be broken" or similar. And BTW I do know what
Marathon is, I just wasn't thinking about games at the time.

>Apple has just released the $1500 PowerMac 6360, a 160 mhz of the 6300
>line which includes 16 megs ram, 1.2 gig, keyboard, 28K modem and tons of
>software...Also, the equivelant UMAX C500 is $1299!

I didn't mention price and although this may very well be a powerful
machine, this was not the point I was trying to make.

Mostly with less (mostly useless) features but rarely reduced
functionality. My WP for example (That's Write 3) does far more than I
need it to do exen with all the TOC/Index generation, instant
correction, macros, scripts etc it's only about 1 meg in size.

It's great that even a low end ST opens windows in an instant without tonnes of processing power even with a hack like NVDI, I don't know if you have used NVDI recently but now it's more than just a OS speeder.

>>Try formatting a floppy disk on your Mac, and while it's

>Anyway, there's no reason why the formatter can't be co-operative.

If you had a pre-emptive OS then there would be no reason for it to have to be.

NVDI is no hack. That just indicates how very little you understand the way that GEM is put together. The system was really quite modular. It doesn't matter whether or not the system is using Atari's graphical api or someone elses. Just point the appropriate trap vector to where you've loaded the new VDI and go. Extensibility in this respect is strictly through design.

Code to the api spec and each of GEM's 5 layers could be provided by entirely separate & distinct groups.

Okay, per a conversation that was going on earlier, I went back and researched the DEC Alpha vs Falcon demo controversy. It was at CeBit '93, and I found the text describing what happened in Z-Net # 496, volume 8, issue 12, posted April 12/13, 1993. I found this particular issue on the Crawly Crypt CD-ROM volume 1, under magazine/znet/ ZNET9312.ASC...

I'm sure this event is mentioned in other places as well, but this is the one I found...

Bill Rehbock of Atari is the person doing the talking here...

DEC (Digital Equipment Corp.) established that a reliable benchmark of the overall performance of a computer was how fast it could calculate and display a 256 color Mandelbrot set. The Mandelbrot set is the most popular example of a class of mathematics know as Fractals. When the data is plotted, beatiful pictures are generated on the computers screen. DEC showed that a Mac Quadra took 12 seconds to create the display, a 486DX-66 took 8 seconds, and the 150 mhz DEC Alpha took 4 seconds...On our (Atari's) video wall, 60 feet away from DEC's demonstation, we showed the same demo being done by a low cost home computer in only --4-- seconds AND in 16-bit color...much to the irritation of DEC...

Of course, we are talking about the Atari Falcon 030 here...!

No, that's correct. It makes the system more persistent against program crashes, for instance.

>Doesn't need one, I put a PPC in it!

You cannot replace a DSP with a PPC or vice versa. They're designed for completely different tasks.

Any cleanly written TOS or GEm program runs perfectly under pre-emptive
multitasking - you may try the MagiCMac demo version to check.

>I don't see any practical difference.

With pre-emptive multitasking, a dialog box does not hinder your entire machine from rendering some graphics during the night (as it does on the Mac). With pre-emptive multitasking, playing a digitized piece of sound will not lock your entire machine (as it does on the Mac). With pre-emptive multitasking, ...

Just because you don't have a clue about the advantages doesn't mean there aren't any.

>Having a more advanced file system is a disadvantage?

In which way is the MacFS "more advanced"? Give me a Be or Unix FS instead, for the MacFS really sucks - copying files lasts about as long as on a TT - just install Copy Doubler on the Mac and don't use Kobold on the TT.

Maybe less, but more than enough. And as you state yourself, more
responsive. Teach me something. I converted a .moov to over 500
jpg files. I wanted a DOS file extension, but didn't check what the
Debablizer default extension was for a jpg file. It turned out to be
.jpeg. Not usable on a DOS file system. Now how, from the Mac O/S,
can I rename all of the extension to .jpg without additional
software?

> The GUI doesn't even give you popup menus, listboxes, etc.

Neither does the Mac unless you hold down the mouse key. With MagiC
(I consider this an O/S upgrade just like your Mac O/S upgrades)
you just hold the mouse over an Icon and presto, pop up files and
menus.

>Everyone
> has to roll their own (popups are in TOS 4/MagiC, but most users don't
> have these) and most seem to do them slightly differently.

I can't image not having a Falcon. So your statement means little to
me. Just like someone who use to have a Mac plus and now has moved on.
The users that have stuck with ST's and Mega's have made the decision
that those machines perform the task required of them and the
results and performance meet their expectations. I would also
think in todays world that they have also been exposed to
Mac's and PC's so made their decision from experience.

>
> >Everyone that uses a TOS based machine with NVDI will tell you

I don't remember anything about what you owned. Have any good
Falcon hardware for sale?

> It's a bit sad that the OS was so cack that hacks like NVDI were
> necessary, even after several TOS releases it was so slow...

Nothing sad about an O/S under developement. TOS 4.04 is pretty
increditable to come from such a small company as Atari was
and performs well under the aged processors that those machines
use.
If it was without merrit, you wouldn't see Mint or MagiC or
Geneva or........ NVDI a hack? I hardly thing so. If you have
owned a TOS machine you know better:)

What about Mac O/S 7.5/7.5.2/7.5.3/7.5.5 ? Just because Mac

updates their own O/S makes it better? I find the third party
O/S software quite refreshing. It gives myself and other users
the option to customize their system to their liking, or budget.
>

> have laughably bad things such as DA's Picture.

What kind of machine are you talking about running Photoshop on?
Again, an Indigo 3 will make ANY Mac look puke green. So if your
wanting to compair a Mega or even a Falcon to an 8500 there must
be some consideration to the performance ratio of the hardware and
software under question. I haven't used DA's Picture. I can't compair
it to Photoshop. I have used Photoline under MagiC Mac and on a
Falcon and can say the I much perfer Photoline to Photoshop on either
Machine, Mac or Atari. I'm sure I would also be please with the
performance
of the application on a Hades 060. Debablizer is a nice conversion
application on the Mac, but even on a 40mhz 040 Mac it is equaled in
speed by Image Copy. Granted it has more funtions, but those don't
cause the speed difference. I think having to drag around all the
extra weight is what slows it down. MagiC dosen't seem to have this
problem on the Mac. But then, you get what you get with the Mac O/S.
All or nothing. It's nice to have kind of a modular system when using
TOS or MagiC.

>

> Anyway, there's no reason why the formatter can't be co-operative.

Ok, writing to a floppy:). Same thing, and bottle neck. Background
DMA transfers are nice under MagiC. Actually I find the Mac O/S
quite usable, if abit slow. When I want to print a mail label or
check my Mail however, I go for the Falcon first. I can be done in
almost the time it takes for the Mac to get warmed up. The Mac
does have much more advanced hardware available for it. I can capture
video direct to harddisk, convert the movie to targa files and drop
it on my Atari formatted harddisk under MagiC, plug in the Falcon and
have a ball with Apex. No Preimer, Quick Flix or Avid, just Apex.

Anyway, as cack as TOS or MagiC are, the Falcon can still hold it's own.
More and more applications are available, so it seems that I won't be
tossing it into a "landfill" anytime soon. My Quadra on the other hand
will find a new owner once a Hades 060 takes it place.

Have you crashed Netscape today?

What would be the purpose? He would fine that the same operating system
that was on the 68000 Mac is on the PowerMac, and that the Falcon has
changed dramaticaly over the Mega. He would discover that TOS is even
more user friendly that it was on the Mega and offers a bundle of new
features. He would still find the Mac confusing and slow, reguardless
of which Mac he tried.
I fail to see where this would benifit you arguement.

Yeah right. Using "forbid()" means multitasking, then? Any commercial game
on the Amiga uses "forbid()" to _prevent_ multitasking.

Some Atari games that multitask: columns, ballerburg 2.1, gemory, gemtrek,
shanghai, kubis96a, nanjing, sokoban, wintris, yukon.

>Prove that the ST shareware is cheaper? Compare equivelant shareware..

Calamus SL is "small" and has "less features"? Tell the guys who publish
the Calamus DTP magazine "invers". They'll laugh in your face.

And "Papyrus 4.5" has just been published in an OS/2 version and got a
great review by "c't".

E.g. an Atari TT (32 MHz 030) is faster in GUI operations than a 9500
Quadra. If the GUI is faster, one can work faster.

And the Mac file selector is worse than even that of TOS 1.0. Seems the
German language "Inofficial Mac FAQ" should be translated to break
Macaholics' blindness.

When have you seen an professionally installed Atari system last time? The
AES is very well capable of such things, it's just that the desktop itself
(which is an application, not a GUI) lacks certain features. Use Thing or
Ease instead and/or install a small program taht does the task (Mac users
consider this perfectly legitimate on the Mac, but Atari users are not
allowed to do this, right?).

On the Atari, you can eject a disk without dragging it's icon to the
trashcan icon (which is _very_ intuitive on the Mac, anyone would throw
something into the trashcan to remove it from the drive). On the Atari,
ejected media are not requested back in certain situations.

>> Its faster, more effecient, just plain better...
>There you go again, nothing concrete (except "faster"; but pre-emptiveness

It _is_ faster, check MagiCMac to get an idea on how fast it is. This has nothing to do with pre-emptive multitasking (that just adds responsiveness to the system and prevents stupid locks by badly written programs).

: The 68040 is not clock doubled.
: The 68060 is neither clock quadrupled nor clock doubled.
: (At least not in the way that instructions are executed with a faster clock
: speed than the external one. Both CPUs use the external clock speed to execute
: instructions.)
: Check out the comp.sys.m68k FAQ for details.

: Using the internal clock in marketing is no hype if instructions are actually

: executed using that clock speed, as is the case with x86-CPUs.

The MC68060 Broduct Brief from Motorola tells me that:
"The timing of the bus is fully configurable to match external
memory requirements".
That implies two timers, one for the bus and one for
the processor.
Hence, it seems to be able to do clock-doubling like the Intels.
Cheers...

The Color Classic was presented ca. 1993 and has a 030 processor (32
MHz?). Otherwise it would be unable to run System 7.

This Color Classic was a 68030/32 mhz on a 16 bit bus, Yea Apple crippled it.. Was this Mac running under 16 bit color/32,000 colors and word? Was your Mega running under 32,000 colors with high res and the equivelant apps. If so get back to me....

No, the 040 doesn't. This has been talked about and harped over time
and time again, and if I still had my old Mac I could give you a quote
from Apple's designers saying this wasn't the case. If you care
enough to do so, post to an Apple technical newsgroup; you should get
a reply from someone in the group givin the correct information.

I'm a bit suprised at you, actually. This is a pretty old topic...

I quote the above statement from Denis above "I used a Mac a couple of times".
Not only do you know nothing whatsoever about computers except what you read
in the monthly rags, you can't read.

>
> > First of all it took me some time to start with the Mac. I realised that

Ya, that is what he said. For him it was easier to use.

Ya, I think he is running with a Panther Graphics card installed. It's
only about $150.00. Blows away Mac video modes through the Quadra
040 line for a lot less money.

Ya, it's kind of confusing. Especially when you upgrade an older version
of
the Mac O/S and don't have all extensions or control pannels loaded on
hard disk.
The install just replaces what you have currently active. I wonder how
many
Mac users are running a crippled system because they don't understand
this.
Let's see, jump over to the Mac newsgroup, jeez, I can't believe the
types of people a mainstream computer platform brings onto the internet.
Some of those questions are pretty ignorant.
I think I see a good place for you to visit 'Plop. Your presence there
should give you the ego boost you need.

Apple will be history soon enough. What do you think, maybe 5 or 10 more
years? At least then the defunct Apple hardware will be available for a
reasonable cost. To bad all the Motorola programmers will be retired and
the up and comings will be working on Intel platforms.
I hope Doug Little is still happy then with his current hobby and
platform :)

Mike

: >
: > 1. The Atari GUI is MUCH quicker to navigate around...
:
: Navigate what?

Yes Navigate! If I want to go to a deeply nested directory it it MUCH
quicker to do so using my Falcon as I always seem to be waiting for MacOS
to finish its frilly bits before I can d-click on the next directory...

: > 2. The Atari doesn't chew as much memory just to run the OS...
:
: The dark ages of an OS, yes.. The Atari OS will never change..

Until each new release of MagiC, MiNT, XaAES, oAESes, Geneva, Thing etc...
comes out...

: > 3. Mac serial ports on 680x0 machines are limited to 57600 baud...
:
: You sure?

Yes. _Most_ 68k Macs are limited in this way. Some newer 68k Macs can do
better (ie. newer Performas, AV macs of course)...

: > 4. Mac software is more difficult to get to grips with than Atari software
:
: Please explain?

Does this need explaining? The learning curve on software is MUCH steeper
on _most_ Mac software I have seen compared to comparable Atari software
with similar features...

: > 5. Macs don't pre-emptively multitask (neither do Atari's unless one has
: >   MagiC but Atari users have that option...)
:
: Mac users have the option to develop on the web, while Atari users do not have
: that utility. Macs can be internet servers while the ST can't.. Macs are
: going places while ST's will go to landfills..

He's getting toey now! How do you mean 'develop' on the web? I happily
develop offline and online web pages for my Atari club, and with each new
version of CAB etc...I can do more of what PC/Mac users might take for
granted with the WWW. Admittedly the Atari is behind in things like Java
etc...but this is only because the w**kers who invented these things
'need' one to sign corporate-propellor-head-mentality-bureaucratic-bumph
licensing agreements, and that, despite what Sun says, will cost big $$$

: > 6. Mac software seems relatively expensive in comparison to Atari

: >   software of a similar nature...
:
: Prove it?

APEX media for 100UK Pounds. Gimme a Mac app that even comes close for similar $ and I'll tear my head off and feed it to myself. Other examples exist like Photoline, DA`s software, Steinberg software, and much more. All these apps provide as much if not more features than similarly priced versions for the Mac...

: > 7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru
: >   Mac serial port, uses 33600/38400 instead of the 31250 that IS the MIDI
: >   standard...that causes timing glitches I have noticed...)
:
: More Macs are in use for that utility..

Really? That surprises me, for as a semi-pro bass-player over the years I would have said that the jerky timimg resolution I hear on Mac MIDI setups would be unacceptable to most studio worth their name...

: > 8. Macs don't have Llamazap!
:
: ST's don't have PPC!

But they do have 68060, and according to Computer DirecT they may have PPC before too long...checkout Computer DirecT's homepage <http://www.compdirect.com/> to see what they are up to...

: > 9. Most files I steal from a mac have to be 'flattened' before another
: >   platform can use them (flattening separates resource and data forks
: >   that are part of ALL mac files...)
:
: Interesting concept..

Yes. A right pain, especially if I'm grabbing large QT movies. The problem exists mainly with software that lives on CD-ROM for the Mac, as such software is written to the CD in a dual-forked format that incorporates the resource and data forks for the file in one chunk...

: > 10.The single button mouse on Mac does become limited after a while,
: >   especially as more and more Atari software uses both buttons now...
:
: Two buttons are here as well..

Yes, but you have to go out and get a two-button mouse first...

: > There are more reasons but I get bored reminding myself of them all. I
: > think I'll hit the PC next time so be prepared for a 100k post! :)

I'm not kidding (much!) :)

I would still like to know if Mr. Sinclair-Day has actually used a Falcon before, and how it was setup...maybe someone should show him one day and make him eat all those words from over all those years...

Chris W.

Yes, but we do it better with apps like HomePage and PageMill. No need to use an ASCII editor, when one just has to plop in text, graphics, photos, video and sound with ease. Now get back to me when you can hook up a digital camera to the ST.

> Pick up any Mac Warehouse mag, and read the prices for software, then

Just like the ST, only Atari. Open an issue of Keyboard magazine and see what platform is reviewed the most..

>>ST's don't have PPC!
>
> AND Macs don't have Apex Media, DSP chips as standard, etc, etc,...

PPC processors have rendered DSP obsolete..

>>Interesting concept..
>
> Like you can take any file and instantly transfer it to any other
> platform without having to "manipulate" it first? :)

Has not happen to me. However, WP5.1 files have to be translated over through the included utility shipped with Performas..

>>> 10.The single button mouse on Mac does become limited after a while,
>>>   especially as more and more Atari software uses both buttons now...
>>
>>Two buttons are here as well..
>
> Is that as standard or do you have to request it? :)
>

Request it like you have to request options on the ST..

>
>You call that change?

Yes, I call over 30 significant items a change! Did you -bother- to
read that post Mr. Sinclair or are you doing a knee-jerk reaction because
I was able to post such a listing??? :)

>> Like dragging the floppy icon to the trash can to eject the disk! Ooooh,
>> anybody would have guessed that one its so intuitive! :)
>
>Thats difficult? Just you..

I -DARE- you to put any 10 novice users in front of a Mac and ask them to
figure out -on their own!- how to get a floppy disk out!!!! Then you come
back here and tell me its just me having difficulties!

>Yes, but we do it better with apps like HomePage and PageMill. No need to use
>an ASCII editor, when one just has to plop in text, graphics, photos, video and
>sound with ease. Now get back to me when you can hook up a digital camera to
>the ST.

Agreed that there aren't any Web page apps -yet- for the Atari...I've sure
someone will though, and I know it will offer most of the features, with
more ease of use, and at a lower cost than comparable programs on other
platforms...(as is the case with most Atari software!) :)

Ditto for the digital camera...

>>   Pick up any Mac Warehouse mag, and read the prices for software, then

Time and time again powerful, efficient Atari programs have been listed
that match up well feature-for-feature against apps on -any- platform,
and yet you still act like you haven't seen them...Your ability to read
and comprehend English is becoming very suspect, Mr. Sinclair...do you
happen to have a green card, by any chance? :)

I doubt that...even the PC world has figured out that the brute
strength cpu approach doesn't work...thats why now they are off-
loading things to video accelerators, etc,...something that has
been known in Amiga/Atari camps for years... :)

 A request for a 2-button mouse has never been made by an Atari user!

Back when I used to be an Amiga Advocate, I tried this argument and got
torn to shreds.

Get a friggin' life!

If I wanted to experience a BMW I would simply walk out my door and across the
street and take one for a real test drive. What a was=
te of bandwidth! Do you think you could pull yourself away from that hunk of
plastic and silicon for even a five minute real life ex=
perience?

no wonder they call computer "nerds" nerds!

Just like I do with POV on the co-op mt Mac, then? Pre-emptive multi-tasking
makes very little difference to the user. It does make life easier for
the programmer, though. I would definitely prefer that the MacOS was
pre-emptive, I'm just trying to say that it's not the end of the world
that it is not.

```
>I've never had the problems that you mentioned, it's not AFAIK wired
>incorrectly but simply utilises un-used pins on the Out port
                        ^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^
```
Precisely. This is in contravention of the MIDI standard, so is
incorrectly wired.

>So what if you think keyboard/mouse handling may cause an overun,
It's fact.
Again (like pre-emptive vs co-operative), it's not a show-stopper; but
 programmers of serious MIDI apps have to work around it.

>you have used NVDI recently but now it's more than just a OS speeder.
I know, I still use it as a font rendering engine. But it's main role
for many people is to replace the cacky slow graphics routines that Atari
couldn't be arsed to fix even in TOS 4. Have you tried scrolling a window
on a 256-colour Falcon screen without NVDI? The fact is that when you
buy something like a Falcon, you immediately have to go out and get a load
of other things (eg NVDI) to make it work properly. I know, I had one.

Er, he was talking about servers, not about html authoring.
As it happens, I wouldn't use a Mac as a web server either.
I do use mine to write my web pages, but they're hosted on CIX' Unix machines.

By the way Mr. Sinclair, or is it Mr. Day?

The version of Photoslop we use is v3, soon to updated, err upbloated to v4.

The version of PhotoLine we used to compare it to does not have all of the features of Photoslop, and Photoslop does not have all of the features of PhotoLine. They are about as close as you can get though. The major difference is that Photoslop has support for layers whereas PhotoLine does not (yet). PhotoLine however handles image scaling better, has better masking tools, has many plug in filters (free), doesn't require expensive accelerator cards to make it useable (err functional) and sells for less.

There are some things that PhotoLine does better than Photoslop and vice versa. This is inherent in software packages even packages on the same platform exhibit these differences...Illustrator vs. Freehand as one example. Live Picture vs. PhotoSlop.

PhotoLine executes, loads and filters faster.

PhotoLine run on the same Mac9500 outperforms PhotoSlop by an impressive margin, this of course under OS emulation called MagiCMac which brings true 32 bit preemptive multitasking to the Mac. Something you won't have until the next millenium if Apple still exists by then.

For me to suggest that the 68060 is architecturally better or even remotely close to the architecture of a PPC would be ludicrous and you took this out of context. The point is that a 68060 running a compact and efficient OS and highly optimized applications is able to outperform a PPC running the bloated garbage coming out for it.

And we sell Macs...

The comparison was between TOS running TOS applications on a 68060 and MacOS running MacOS applications on a Mac 9500. The time to do a specific task on both machines is what we are comparing here. The DirecT60 will blow the doors off a Mac, or any other desktop for that matter, on pretty much any test we can throw at it.

If there was not so much wasted resources, so much bloat and so much disk intensive access going on, this 9500 should outperform a 68060. No doubt about that. But, it doesn't because the macOS is slow, hell my friends Volkswagen is faster than the MacOS.

I asked you to do some benchmarks on a 20MB TIFF and whatever app you wanted to use and haven't heard back from you. Having a hard time finding a 20MB TIFF and an app that can come close to the speed I posted? Whenever you are ready...

How about a few examples?

> Try formatting a disk, and at the same time opening Photoshop...<heh>

For fuck's sake, can no-one come up with a better example than
formatting a floppy? Maybe I'm unusual, but I format about one per month.
As I said elsewhere, there's no reason why a disk formatter can't be
co-operative anyway. The Atari and Mac ones are not, but it would be
trivial for Atari or Apple to fix that. Neither seem likely to :-(

> Then you don't know what you are missing, do you??? <smile>

I did have a Falcon, remember!

Michael Grove <mgrove@ridgecrest.ca.us> writes:
>from the Mac O/S, can I rename all of the extension to .jpg without
>additional software?
You can't (apart from the long-winded manual approach, of course). But I don't see how you can do this with MagiC either. It's trivial with a Unix shell, of course. If your complaint is that the Mac let you use .jpeg as a file extension, then I don't understand your problem; you seem to be saying that a limitation in the DOS file system is a problem with MacOS.

>Neither does the Mac unless you hold down the mouse key. With MagiC
>(I consider this an O/S upgrade just like your Mac O/S upgrades)
>you just hold the mouse over an Icon and presto, pop up files and
>menus.
I was talking from a programmer's point of view. The MacOS contains functions for putting up and handling these things. TOS does not. MagiC does, but then most apps assume that they may be running under plain TOS, so the programmers end up rolling their own menu etc routines. As I said, they don't all do them the same.

>Have any good Falcon hardware for sale?
No, I sold it a year ago. The person I sold it to has shifted it on to someone else already. I have a 1040STF going cheap though!

>the option to customize their system to their liking, or budget.
I'd agree with this, I use a few third party add-ons to improve MacOS, including PopupFolder, which adds functionality that's built-in to Ease. There you go, one point to Atari!

>Debablizer is a nice conversion application on the Mac, but even on a
>40mhz 040 Mac it is equaled in speed by Image Copy.
Dunno about DeBabeliser, I don't have it. I do know that GraphicConverter decodes and displays faster than ImageCopy, even when running on exactly the same machine.

>Have you crashed Netscape today?
:-)
Don't use it any more, it requires too much memory due to poor implementation. Internet Explorer is much more frugal for the same (ish) functionality.
I don't like using IE on principal, but Netscape is just not sensible

```
any more.

That's not really a function of the multi-tasking nature of the OS.
The STe etc can do this because digitised sound is done via DMA; it can
do this with plain TOS, which is clearly not pre-emptively multitasking.
I will not comment on the sound architecture of the Mac as I do not know
enough about that subject.

You don't need 'em, if Mac html tools are anything to go by. PageMill is
junk. I think that a half-decent text editor (I use Emacs) is the best
html tool by far.

> that match up well feature-for-feature against apps on -any- platform,
You can say this as many times as you like, it doesn't make it true.
Where's the decent Atari spreadsheet? As for WPs, I had Papyrus 3 and
it didn't even have a word count; I believe that this is true for
Papyrus 4 too.

Getting down into the depths of a directory tree is one aspect at which
the MacOS interface does struggle; I recommend PopupFolder, which makes
this easier and improves the file selector too.

>APEX media for 100UK Pounds.
That's the only example anyone has managed to come up with so far.

>DA`s software
DA's software is largely very poor quality (I had Picture, and still
have Vektor Pro) and are not being developed, or even bug-fixed, any
more.

\>conviction in your opinions to be named?

We kicked you out 220 years ago over such stupidity.

This is a public forum; my identity is not required.
If you cannot address my ideas and then feel the need
to attack things which are distinctly not my ideas then
you show far more cowardice than do I.

The GEM VDI can be replaced quite easily without the need for 'hacking'. Merely replace the appropriate trap vector with a pointer to whereever you have loaded the new trap handler. That trap handler should be little more than another jump table with entries for each function (bios,xbios,gemdos,vdi,aes). Then just follow C call frame conventions for whatever language you happen to be using.

Admittedly, however, the writters of NVDI could have gone out of their way to make their lives complicated.

NVDI should no more be a 'hack' than an alternate winsock.dll for windows should be.

If you have made a good point that the person has no response to then
why should they keep it int he post, it just wasted bandwith. If it's
ut then the discussion is over on that point, you 'win'. As far as
people just cutting out good questions goes I completely agree.

>Never mind; you can go back to bashing Peter Sinclair-Day, and to believing

It's been good having you here to be honest, someone with decent
arguments has made a very refreshing change and set us straight on a
few things.

[snip 3 legitimate points]

You didn't seem to have read my posting correctly. How many posts have been made in this group that are completely unconnected to Pete ie followups to his cack? (Off topic stuff about Ethernets not included). I would estimate about 2 in the last month. The situation has changed a tad recently with the other bloke (Dave?) making some good points but he says he's off again so it's just back to Pete.

It's kind of like that saying "I despise what you say but I would defend to my death your right to say it". But it's more to the point that if he didn't post then this group would be empty and defeating his 'arguments' time and again is quite fun.

The evolution from the POWER chipset goes like this:

1989, IBM introduced the POWER chipset in the RS/6000 ("RS" = "RISC
System") workstation. POWER stands for "Performance Optimisation With
Enhanced RISC", whereas RISC stands for "Reduced Instruction Set Computer"
(but I guess we're all familiar with that by now)

In 1991 IBM and Apple joined together to produce a range of computers
based around a single-chip version of the POWER chipset. (THe POWER
chipset was [if memory serves] seven discrete chips.

Apple insisted that Motorola join in, as Motorola was Apples primary CPU
provider.

Between them, they defined the PPC (PowerPC) architecture.

The first chip was to be known as the PPC 601. It was essentially a POWER
chip with most of the PowerPC instruction set.

Some of the POWER instructions were known to slow the whole chip down, and
were left off the 601 chip.

Future implementaions were to be a 602 (what it was inteded for I don't
recall at this point in time), a low power consumption 603 for portable
computers, and a 604 as the first full-PPC implememtation (the remaining
POWER instructions do not exist on 604s).

(For further info, read the FAQ in comp.sys.powerpc)

Such as?

:   If you can provide some comparative
:   SPECmarks or some empirical comparisons, knock yourself
:   out.

Looking up and down the CPU Info Center is a good start.
"The Ingram studies", "The Performance Database Server" or even
"STREAM" benchmarks offers additional elaboration to put things
in perspective..
"The Benchmark Gateway" might also be of some interest.

:   This whole melee got started when some Mac Cheerleader
:   couldn't countenance the possibility of an 060 TT clone
:   outrunning powermacs on certain graphics intensive
:   operations.

"..certain graphics intensive operations". That kind of narrows
it down, doesn't it?
What do you mean by "graphics.. operations" actually?

Sure my 060 running SS is a bit faster in a few situations in
relevance to a slow PPC 601.
I belive this is a software-thingy though.

:   Perhaps the PowerMacs are just sucking cpu cycles into some
:   tiny onboard Black Hole and the T60's feats are less a
:   tribute to it than testimony against Macs.

You were arguing that the 060 is twice as efficient as the PPC.
This argument is flawed - system overhead is highly irrelevant.

:   The Mac/PC crowd doing less with more... nah... '-p

What would happen, you think, if we were to put an 060 in a Mac?
Cheers...

Having power and utilizing it well are two completely different problems. If an alpha or mac or PC cannot be made to fully realized their potential, then the existence of that potential is really quite meaningless. Before numbers get crunched, they have to make it to the cpu first. It seems with Mac/PC, numbers have difficulty getting there [cpu].

The <tangent> comments were replies to me 'calling out' Peter.
That someone else was able to 'rescue' Peter really does nothing
to address the original taunting. Furthermore, the original issue
was Photoline vs. Photoshop. I had no interest in the other 2 apps
(whatever they were) and had no interest in wasting bandwidth
repeatedly copying that response again and further distributing them
across the planet.

Peter still doesn't know what he's talking about.

: A lot of applications that people frequently use are number cruchers.

  All computer software, in a way, is a number cruncher, because that's
really a lot of what the CPU is doing (moving around numbers).  But
there's a difference between a number cruncher in the general sense and a
_real_ number cruncher, i.e., one whose entire purpose is moving around
numbers.

  For example, most of the benchmarks out there are _real_ number crunchers.
Say you have a simple floating point test.  You could write something
```

like (this is in C):

[...]

```
     for (x = 0; x < 10000l; x = x + 0.01)
          {
          for (y = 0; y < 10000l; y = y + 0.01)
               {
               x + y;
               x - y;
               x * y;
               x / y;
               }
          }
```

[...]

This assumes that x and y are floating point numbers and that all you're testing is raw computational power. What this loop does is really simple; so simple, in fact, that on any reasonable computer it will load itself into the cache and sit there. The time taken during the benchmark will be roughly equivalent to the time taken to crunch the numbers.

A simple benchmark like that is far different from, say, being connected to the Internet while running HTTP and FTP servers, INN, a mud, and having a few dozen users doing their own thing. The latter is far more than simple number crunching. This is again different from a PC user running Quake. Again, it's more than simple number crunching, and while simple number crunching may be what the PPC series is good at, it's not a real world test of the PPC's abilities.

: OK, you can call it an application if you want, but in this case the OpenDoc
: people are trying to draw the distinction between monolithic do-everything-in
: one-program applications and OpenDoc parts, which are tiny self-contained
: modules that do only one specific task.

As are normal applications. Baroque, elephantine monstrosities such as
Net$cape and M$ Internet Explorer are not real `applications', but
actually `wastes of time' (I don't think very much of either).

If you want self contained applications, get separate programs.

: If you don't like using parts of
: Cyberdog, you can replace them with parts you don't like; you don't have to
: use all or nothing.

As you can with normal programs.

: >   Furthermore, if it's not some monolithic thing then why is it being
: >   referenced as such? Unix has had internet functionality broken into
: >   many small self contained parts for years. That is nothing new.

: Cyberdog was being referenced as a suite, which is what it is. It is a
: collection of OpenDoc parts which are collectively given the name "Cyberdog."

So which OpenDoc parts fall under this suite? Do all parts fall under
the giant umbrella of `Cyberdog'? Or do only the included parts
constitute `Cyberdog'?  If the former, `Cyberdog' is simply a new name
for OpenDoc along with a fancy front end. If the latter, `Cyberdog' is
really just the included suite of parts, and should be considered solely
on the basis of those included parts, not on any additional extensions.

: The difference between small applications and OpenDoc parts is that the
: parts can all be embedded in each other, the parts all share the same
: interface. The parts are designed to work seamlessly with each other,
: and this is not necessarily the case with "small" applications.

If an application doesn't have an interface that's fairly easy to learn, then it's most likely not worth using. There are exceptions to this, and I'll admit that a more difficult interface can be worthwhile (for example, emacs). But that difficult interface is often there for a reason; you couldn't effectively create a menu based sed or awk.

The unified interface concept is simply an appeal to the point-and-drool masses who most likely don't even need a computer.

: > processor (like Windows Write) as a demented form of spreadsheet.

: If you use OLE or OpenDoc, you don't have to worry about losing information
: (formatting information, for example, like when you copy from a spreadsheet
: to a word processor and lose formatting information).

If you're losing formatting information, that shows that the word processor and spreadsheet are not interfacing with each other properly, not that you need an extra layer between you and the real work. The layer is a possible solution, but a much better one, IMHO, is to include an option in the spreadsheet to save or copy the spreadsheet as text and include the formatting in there (easy using a printf).

Actually, on the Macintosh at least, it is far easier to get a process
onto the CPU then to get it off the CPU. Once a Mac program gets
control (and it has controlit when it is loaded) then it can use the
processor as it sees fit until it voluntarily reliquishes it.

A lot of people use their Macs for image processing. Image processing tends to be CPU intensive and does not rely heavily on either IO or the operating system.

What is that co-operative shite is Geneva, which also makes everything
multitasking. I don't use Macs so I don't know. Do you really have to
have special applications to utilise multitasking?

        Amazing that such a marginal machine would have superior
        software available for it? Although, if this is the case,
        this is as much an issue for the machines in question than
        anything else.

>    This argument is flawed - system overhead is highly irrelevant.

        I was arguing that it is consistent with the previous comments
        wrt photoline and it is consistent with the usual performance
        gains from one member of the 68K family to the next and the spec
        sheet for the 68060 supports the notion that it performs like a
        200Mhz 040. Also, if the Mhz spec is only the external clock and
        not the internal clock (as on Pentia) then that would also be
        consistent with the 68K family history as well. If the 060 is
        internally clock quadrupled (as someone else suggested, without
        the usual intel hype) that might help explain the inconsistent
        Photoline results.

        System overhead is highly relevant. If the system is taking up
        too many cpu cycles playing with itself, then your processes wont
        get enough cpu time and that beast under the hood wont do you a bit
```

of good.

>
>: The Mac/PC crowd doing less with more... nah... '-p
>
> What would happen, you think, if we were to put an 060 in a Mac?
> Cheers...

It would still be underutilized. You didn't comprehend the point.
An Atari or Ameoba could have systems with 1/10 or 1/100 the
raw power and still get more done if that meagre power it does
have is more properly utilized.

Develop your 'wares as if you will never run out of computing
resources and you always will run out...

If your number-crunching process is awake then this is fine.
Otherwise, not much number-crunching is going to be going on.

I guess I'll have to go tell the boss of the electronics company I work for
that I'm not qualified to do my job, because I don't understand engineering.

When you start the number-cruching operating then that process
must be "awake". I don't like the word "awake" though because
it is usually used to indicate that a process is not suspended.
The MacOS never suspends processes.

No, it means that a process is getting CPU time.
If it is not, than the process is 'sleeping' no matter
by what mechanism it came to be 'sleeping'.

It's a desktop applications suite that makes exclusive use
of object imbedding. There's just a generic editor for all the
included objects... text, dtp, spreadsheet, graphics...

It out OLE's OLE by quite a bit but, like much freeware the
interface leaves much to be desired.

If a process is asleep then it is not currently available for execution (for reasons other than IO blocking). The MacOS always considers a process available for execution.

Hi there!

Here are my ten reasons to use Atari (Falcon in particular) over Mac...

1. The Atari GUI is MUCH quicker to navigate around...

2. The Atari doesn't chew as much memory just to run the OS...

3. Mac serial ports on 680x0 machines are limited to 57600 baud...

4. Mac software is more difficult to get to grips with than Atari software...

5. Macs don't pre-emptively multitask (neither do Atari's unless one has MagiC but Atari users have that option...)

6. Mac software seems relatively expensive in comparison to Atari software of a similar nature...

7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru Mac serial port, uses 33600/38400 instead of the 31250 that IS the MIDI standard...that causes timing glitches I have noticed...)

8. Macs don't have Llamazap!

9. Most files I steal from a mac have to be 'flattened' before another platform can use them (flattening separates resource and data forks that are part of ALL mac files...)

10.The single button mouse on Mac does become limited after a while, especially as more and more Atari software uses both buttons now...

There are more reasons but I get bored reminding myself of them all. I think I'll hit the PC next time so be prepared for a 100k post! :)

What the hell does that actually mean?

>3. Mac serial ports on 680x0 machines are limited to 57600 baud...
Nice try. Come back when you know what you're talking about.
I run my Performa 475 at 115K2.

>4. Mac software is more difficult to get to grips with than Atari software...
eg? How do you get to grips with Atari Photoshop, for example? Oh,
you can't, sorry.

>5. Macs don't pre-emptively multitask (neither do Atari's unless one has
>   MagiC but Atari users have that option...)
What difference does pre-emptive multitasking actually make to you?
I don't see any practical difference.

>7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru
>   Mac serial port, uses 33600/38400 instead of the 31250 that IS the MIDI
>   standard...that causes timing glitches I have noticed...)
I can't really comment on Mac MIDI, as mine doesn't have a MIDI interface.
But no MIDI interface runs at 38400, as it's not MIDI then; the other
end would not understand it. Also worth pointing out that the Atari's
MIDI implementation is fucked, both hardware (wired incorrectly) and
software (keyboard/mouse handling can cause an overrun).

>9. Most files I steal from a mac have to be 'flattened' before another
>   platform can use them (flattening separates resource and data forks
>   that are part of ALL mac files...)

Oh, I see. Having a more advanced file system is a disadvantage?
Anyway, I just moved a load of pics from Mac to PC; no problem, it just
copies the data part and that contains the image.

>10.The single button mouse on Mac does become limited after a while,
>   especially as more and more Atari software uses both buttons now...

Agreed, I bought a multi-button mouse for my Mac.

>/|\ ATARI Falcon030 16Mb/340Mb/32Mhz/DSP/FPU

Blimey! A 32MHz 030. Wow! And how fast does it run in 16-bit colour,
and at what screen resolution?

I can't believe I fell for this infantile flame bait...

Hello ST-fools,

I'm looking for a girl, Carole Lepilleur. He had a letter on one of the Atari
newsgroups. I discussed several sings with her, now I've sent a letter again,
but haven't got any reponse yet. Now, I "fingered" her and got this reponse:

Account used on Tue Oct 1 10:08 (23 days ago)

It was long ago. Carole, if you're reading this, please write to me to "thehidden@ludens.elte.hu" or "sebi@augusta.inf.elte.hu"!

Thanks!

The Hidden

(P.s.> If someone of you know her, please tell her to contact me.)

: >
: > "..certain graphics intensive operations". That kind of narrows
: > it down, doesn't it?
: > What do you mean by "graphics.. operations" actually?

: Someone mentioned overlapping functionality with photoshop.

Hardly relevant in our system vs system comparison, as I'm
sure you comprehend.

: > Sure my 060 running SS is a bit faster in a few situations in
: > relevance to a slow PPC 601.
: > I belive this is a software-thingy though.

: Amazing that such a marginal machine would have superior
: software available for it? Although, if this is the case,
: this is as much an issue for the machines in question than
: anything else.

I'm not sure I follow you, elaborate. :)

: >
: >: Perhaps the PowerMacs are just sucking cpu cycles into some
: >: tiny onboard Black Hole and the T60's feats are less a
: >: tribute to it than testimony against Macs.
: >
: > You were arguing that the 060 is twice as efficient as the PPC.
: > This argument is flawed - system overhead is highly irrelevant.

: I was arguing that it is consistent with the previous comments
: wrt photoline

Which are fundamentally wrong.

: and it is consistent with the usual performance
: gains from one member of the 68K family to the next and the spec
: sheet for the 68060 supports the notion that it performs like a
: 200Mhz 040.

I can assure you that there are NO serious benchmark showing
this, not even silly ones I'm prepared to bet on.
For most integer opperands the 50Mhz 060 performes like a
50-60MHz 040, although the FPU is on heavy steroids.
For memory-intensive tasks or software taking advantage of its
superscalar features it's about 3-4 times faster than a 25Mhz 040.

: Also, if the Mhz spec is only the external clock and
: not the internal clock (as on Pentia) then that would also be
: consistent with the 68K family history as well. If the 060 is
: internally clock quadrupled (as someone else suggested,

Wrong I assure you.

: without
: the usual intel hype) that might help explain the inconsistent
: Photoline results.

The bclk (bus-clock) is doubled to form the pclk (processor-clock),
in much the same way as the P5s.

: System overhead is highly relevant. If the system is taking up
: too many cpu cycles playing with itself, then your processes wont
: get enough cpu time and that beast under the hood wont do you a bit
: of good.

It is not relevant in our comparison in which you started off
by stating that the 060 was twice as fast as the PPC601.

: >: The Mac/PC crowd doing less with more... nah... '-p
: >
: > What would happen, you think, if we were to put an 060 in a Mac?
: > Cheers...

: It would still be underutilized. You didn't comprehend the point.
: An Atari or Ameoba could have systems with 1/10 or 1/100 the
: raw power and still get more done if that meagre power it does
: have is more properly utilized.

Of course you're right, but this is a different matter.

: Develop your 'wares as if you will never run out of computing
: resources and you always will run out...

Sure.
Cheers...

It means that, with no direct compairson of functionality,
The GEM desktop looks, feels and smells faster than the Mac OS.
Everyone that uses a TOS based machine with NVDI will tell you
this. A good compairson is to have MagiC Mac loaded on your
Performa. You will instantly notice that the MagiC enviroment
responds quicker than the Mac OS does.

Why would an Atari user want to use Photoshop when they have a much
better
option? I think what he means is that most Atari software has a much
simpler user interface that accomplishes much the samething as the
slower, more user friendly (ha, ha, ha, ha) Mac OS.

That is the point. You don't see the difference because it's in the
background:). Try formatting a floppy disk on your Mac, and while it's
going about it's thing, try to launch Photoshop. I think you will get
the point.

Wired about as wrong as Apples GEO Port :). And as easily fixed.

Ok, take a UUE encoded file from a PC disk and load it into teach text,
of simple text. Save it and then try to decode it. Does it work?

Navigate what?

> 2. The Atari doesn't chew as much memory just to run the OS...

The dark ages of an OS, yes.. The Atari OS will never change..

> 3. Mac serial ports on 680x0 machines are limited to 57600 baud...

You sure?

> 4. Mac software is more difficult to get to grips with than Atari software...

Please explain?

> 5. Macs don't pre-emptively multitask (neither do Atari's unless one has
>   MagiC but Atari users have that option...)

Mac users have the option to develop on the web, while Atari users do not have
that utility. Macs can be internet servers while the ST can't.. Macs are
going places while ST's will go to landfills..

> 6. Mac software seems relatively expensive in comparison to Atari
>   software of a similar nature...

Prove it?

> 7. MIDI implementation on a Mac sucks (due to non-standard baud-rate thru
>   Mac serial port, uses 33600/38400 instead of the 31250 that IS the MIDI

More Macs are in use for that utility..

> 8. Macs don't have Llamazap!

ST's don't have PPC!

Thats funny, I am not aware of any Games multitasking. At least the Amiga did in some form..

>>So? I have 49 megs ram and still paid under $1000....Much cheaper to boot!
>
> Still extra cost no matter how cheap.

True, not cost prohibitive. To do any serious work on the Falcon required 14 megs. Atari did sell a 14 meg version. I use many low memory apps. I still use a Microphone version dating back to 1992..

Now, that I am starting web development(a pipe dream on the ST), the ram will come in handy..

>>Same here...My system came with over $500 in free apps.

> shareware prices).

Really... Have you ever heard of Bmug and Educorp, the premier distributors PDS stuff?

Prove that the ST shareware is cheaper? Compare equivelant shareware..

> isn't.

Are you inhaling funny stuff? Prove it that the power/performance ratio is better. Apple has just released the $1500 PowerMac 6360, a 160 mhz of the 6300 line which includes 16 megs ram, 1.2 gig, keyboard, 28K modem and tons of software...Also, the equivelant UMAX C500 is $1299!

>>> 7. Small applications
>>We have those too! We also have big bloaty ones as well..
>

> machine flies along and is a luxury rather than a necessity.

I hate to reign on your pararde, you are talking out of your ass. The Atari apps are all small with less features and functionality. The Mac market has both serving all kinds of users. Choices prevail..

>>> 8. The Atari operating system is more intuitive

>>I beg to differ.. So were is publish/subscribe, opendoc, cyberdog, quickdraw
>>3d and so on?
>

>>using a Mac?
>
> Maybe it died or something. I don't remember him saying anything
> about an ST thou'.

He most likely found the Falcon rather limiting..

In what way? Do you have anything concrete to say here, or are

point to any independent studies which show that the Atari GUI is easier
to use. I suspect that there are none, but will be happy to be proved
wrong.

> Hmm...do you think he might have actually meant 68000 Macs?
They're so old that they're irrelevant.

> Its faster, more effecient, just plain better...
There you go again, nothing concrete (except "faster"; but pre-emptiveness
does not in itself make anything faster at all).

> Funny how an awful lot of very professional, and powerful software
> got written for it anyways, isn't it? :)
But all pro s/w now is for PC and Mac...

> AND how fast does you DSP chip run on your Performa?   <heh>
Doesn't need one, I put a PPC in it!

Michael Grove <mgrove@ridgecrest.ca.us> writes:
>It means that, with no direct compairson of functionality,
>The GEM desktop looks, feels and smells faster than the Mac OS.
There's the rub. We are fully aware of the trade-off between functionality
and performance; the ST has little functionality so can be faster.
The GUI doesn't even give you popup menus, listboxes, etc. Everyone
has to roll their own (popups are in TOS 4/MagiC, but most users don't
have these) and most seem to do them slightly differently.

>Everyone that uses a TOS based machine with NVDI will tell you
Remember that I have owned a number of Ataris, including a Falcon.
It's a bit sad that the OS was so cack that hacks like NVDI were
necessary, even after several TOS releases it was so slow...

>Why would an Atari user want to use Photoshop when they have a much
>better option?
Like what? Photoshop was just one example, but there's no equivalent
Atari app available as far as I can see (certainly not in the UK). We
have laughably bad things such as DA's Picture.

>Try formatting a floppy disk on your Mac, and while it's
>going about it's thing, try to launch Photoshop.
I was just waiting for someone to come up with the "formatting a floppy"
line. That's the only one anyone ever seems to come up with, and as I
format a floppy about once a month, it's not really a big deal, is it?
Anyway, there's no reason why the formatter can't be co-operative.

>Ok, take a UUE encoded file from a PC disk and load it into teach text,
>of simple text. Save it and then try to decode it. Does it work?
Dunno, I just drop PC uue files onto a decoder (uucd) and a pic comes
out. Seems simple enough. And I have uucd configured to give the file
the correct type such that a double click then brings up the pic in
GraphicConverter. It would be even nicer if GC understood uuencoded
files, I could do it in one step then.

An advocacy group with only Atari advocates would be booring! It'd
just be "I love Atari", "Yeah it's great", "I agree". You need someone
to aim your defence at.

[in response to a post about Cyberdog and QuickTime VR]

> Then name the firms and tell us what they use Apple's Megolithic internet suite and Apple's video file format for?

See my other message about Cyberdog. It is not a megolithic suite.

QuickTime is not a video file format. QuickTime "movies" can contain text, graphics, sound, music, full motion video, VR panoramas, and 3-D objects. QuickTime VR is a subset of QuickTime for displaying VR "panoramas" -- you can look at a photorealistic scene, and rotate 360 degrees, around, up and down. Every major Mac developer supports QuickTime. Many if not most multimedia CD-ROMs are QuickTime-based. Sun Microsystems and Netscape both use QuickTime, as well as SGI if I'm not mistaken. (I'm not sure about SGI, but I believe I read it somewhere.)

> Until you can even manage a point by point comparison of ClarisWorks and MSWord, you aren't even really justified in calling them uncomparable. You can't even compare these two rather mundane packages in any meaningful sense let alone anything else.

Some features that Microsoft Word has that ClarisWorks does not:

* Automatically corrects spelling and typographical errors as you type
* Can automatically format your document
* Can be automated with its WordBasic scripting language, which is more complex than ClarisWorks' simple macro facility
* has 100-level "Undo"
* has an annotation system
* has a revision-tracking system to track changes to documents
* has a grammar checker
* has automatic footnotes and endnotes
* has index and table-of-contents generation

There are more features that Microsoft Word has that ClarisWorks does not; I have not listed them all. Keep in mind that ClarisWorks is not intended to be a heavy-duty word processor like Word. ClarisWorks is an integrated program like Microsoft Works or Atari Works. Word is a dedicated word processing program.

Clearly, a word processing program that does not have automatic footnotes and endnotes, or index and TOC generation, couldn't be considered a high-end word processor. That's not to say that ClarisWorks is not good, or that it's not popular -- it's just that it's aimed at a different market from the one Word is aimed at.

> Translation: Cyberdog = the apple equivalent of the do all megolithic
> internet app.
> Cyberdog = Apple Navigator or Apple Explorer.

Actually, Cyberdog is not a monothilic Internet application. It is not an application at all. It is a collection of OpenDoc parts. An OpenDoc part is a small, self-contained module that does one specific task. For example, Cyberdog is made of separate OpenDoc parts -- a mail reader, news reader, web browser, and so on. Because each OpenDoc part is self-contained, they can be replaced without affecting the other parts. For example, Netscape is working on their own web browser part which you could use to replace Cyberdog's web browser part if you want. Anyone can replace any part with any other part that does the same thing, and they will all still work with each other seamlessly.

The idea behind OpenDoc is that instead of companies building monolithic applications that do everything, companies write small parts that do one specific task very well. Because OpenDoc parts all share data and interact with each other seamlessly, you can build your perfect tool! You can buy a text editor part from one company, a spell-checking part from another, a grammar-checking part from a thid, a drawing part from a fourth -- instead of buying one monolithic application that does everything, but may not do everything the way you like it. It allows for much more freedom.

For example, you could use an OpenDoc FTP part to embed a picture from the Internet into a word processing document. Imagine a spreadsheet that is linked to a gopher server via a gopher part -- it could fetch data from the internet and update the spreadsheet automatically.

What's even better, OpenDoc is cross platform. It is an open standard that is not controlled by any one company, and the source code can be licensed and ported to any platform, even Atari.

It's a pretty strong claim to state that the 68060 is comparable in speed to the Pentium Pro and PowerPC 604. Do you have any hard evidence to back that up?

Cyberdog and OpenDoc are much more than that, and they are also available
free of charge from Apple on their web site.

One doesn't have to believe that Motorola (who incidentally wasn't the only company involved in the design of the PowerPC) has somehow faltered. Consider the fact that the 68060 is much older than the Pentium Pro and PowerPC 604; it was released shortly after the Pentium was released. The 68060 was not designed to compete with the Pentium Pro or the PowerPC 604 because those two processors didn't exist when the design of the 68060 was started.

```
>    Admittedly, my views are merely the extension of the expectations

>    same company, and in the end each other.
```

Not necessarily. Lots of companies make products aimed at different markets. There is not necessarily any connection between the PPC and the 68060, especially since the PPC was a co-operative effort between Apple, IBM, and Motorola. For example, lots of computer companies make low-end and high-end computers. Just because company A's low-end PC isn't as powerful as company B's high-end PC, does that mean that company A's *high-end* PC is somehow not as powerful?

You're in effect saying that it would be hard for you to believe that the PPC604 is as fast as the Pentium Pro if the 68060 is not. But the 68060 is older than the PPC604 or the Pentium Pro. And of course lots of companies make products of varying levels of power -- one doesn't have to design all the products one makes to be as powerful as possible, simply because there is often a huge tradeoff between power and cost.

Another possible explanation was that Motorola didn't want to spend too much money on an architecture that it knew was soon going to be left by the wayside. Intel is a very large company with large sales and a lot of money. The signs that Apple was looking for new processor technology had been around for a while, and Motorola must have known that Apple would move away from the 68000-series. (Heck, it was in the alliance with them that designed the PPC!) If they knew that there largest customer would eventually abandon them, why would they try to concentrate on making the 68060 as powerful as the Pentium Pro (which didn't exist at the time) when they knew the market for this chip would be in the embedded controller market and not the home PC market?

I have a lab full of fast PEntium and Pentium Pro systems. $2800 for one of
the cheaper ones would be a real bargain. The majority of them run from $4000
to $50k - and most of them have plain VGA cards with DRAM.

Yes, but for how much money?

"Open" standards that cost large amounts of up-front cash don't become
standards.  Quick example:  MicroChannel Architecture.  Instead, EISA became
the defacto standard - it was a /free/ open standard.  IBM eventually
abandoned MCA because no one would pay them for the license.

>There is not necessarily any connection between the PPC and the 68060,

The 060 is a 2nd generation extension of the 68K line which has always been in direct competition with and exceeded the 80x86 line. Despite it's name, the P6 is just the 2nd generation extension of the 80x86 line. If the P6 can compare well to a PPC604 than so should an 060. Either that or they should have named it an 680S40 or somesuch.

>especially since the PPC was a co-operative effort between Apple, IBM, and

The 68K line was never low end by any stretch of the imagination. That it suddenly becomes so is an interesting convolution of history. Should they want to break with that history, they should be very explicit about it. There should be no doubt that the family is no longer following the progression that it once did from 68K->68020->68030->68040. Anything else is just cheap, bait and switch marketing. It should no more be tolerated from Motorola than it should be tolerated from Cyrix or AMD. As their 'baits' stain them so do Motorola's 'baits' stain it.

If you like buying from people who lie to you: so be it.

However, the only one who ever established any real information on the performance of these chips indicated that indeed 060's and 686's are comparable.

    Either this is the case, or motorola is intentionally misleading the
    buying public with thier naming schemes. If this cannot be taken at
    face value, it is a bad reflection upon motorola and anything they

make (especially in this domain) including PPC's.

Sauce for the goose is sauce for the gander.

Sounds kinda like pluggins. So what makes this any different from the
IRC, mail and news ActiveX controls/plugins that come with IE3.

Furthermore, if it's not some monolithic thing then why is it being
referenced as such? Unix has had internet functionality broken into
many small self contained parts for years. That is nothing new.

> ever heard of desk accessories, or the WWW package?

No, they're not like desk accessories at all.  Desk accessories are not
object-oriented modules in the way that OpenDoc parts are.  OpenDoc parts
can be embedded in each other.  You can embed any OpenDoc part into any
other OpenDoc part -- for example, you can embed an internet link into a
spreadsheet, a drawing into a word processor, a rotating 3-D animation
into a painting, and so on.  No part has to know anything about any other
type of data other than the one it handles.  This is very different from
desk acessories.  You can't embed one desk accessory into another.

The tools that allow developers to create and test their own OpenDoc
parts are available for free, so there is no cost to develop OpenDoc
parts. Component Integration Labs, the non-profit corporation that
controls OpenDoc, has over 3000 members, including companies such as
Netscape, Apple, IBM, Sun, Novell, Oracle, and Adobe. Membership in CI
Labs is $350 a year (There are levels of membership that cost more, but
offer more benefits.) Members receive source code and a perpetual licence.

OpenDoc is out now for Mac and OS/2, and AIX, Windows NT, and Windows 95
versions are in beta. If I'm not mistaken, Sun is porting OpenDoc to
Solaris. Many companies have announced their intention to create OpenDoc
parts. Learn more about OpenDoc at http://opendoc.apple.com/ and
http://www.cilabs.org/

So either the Atari team coded better or the hardware was better,
but the end-result is the same...the Atari version was faster.

Keep in mind that this was a spur-of-the-moment response to a demo they saw on a supposedly superior machine! I'll take the Alpha teams' response to it as testimony--they were infuriated!

    Try $2600 with a 17" monitor, 200Mhz P5, 32Meg Ram, high end
    video and all the other multimedia baubles.

    Your lab was robbed.

    $4000 will get you that silly Gateway with the 31" monitor...
    ...or a reasonably priced clone and a big CAD monitor.

I always hated those auto correctors...

On a personal note, my mother asked for consultation on this subject last night. For some reason she has MS Word 6 on the brain. You can imagine her horror when I told her what kind of machine she would need to run the beast and how much it would cost her. Then, I coaxed out of her what her actual requirements were.

After this, I just recommended she use the editor built into windows: Write.

David Pischke
(pischke@ecf.toronto.edu) wrote:
: Unless the Atari group used the same algorithm as the Alpha team, it doesn't

Don't forget that the Atari ST was THE concept machine for the '80's. GEM was the brainchild of Gary Kildale of Digital Research Inc. If you remember, GEM was written for the PC. Of all the GUI's (this includes the PARC machine, Apple's Mac and Amiga, GEM for the Atari was the most elegant. It analogized the "office" (file drawers, folders, etc.) the best. If you find fault with GEM, then you didn't like Gary's (DRI's) vision.

I am glad that I bought that ST back in '85 instead of the Mac or Amiga. Those are fine machines, they just were Steve Jobs and Jay Miner's visions. If you were to compare side-by-side, you would see what I mean. My kids needed no help with the Atari. It just ran. Now you could find fault with TOS (written in C - not as fast as it could have been) and that is fine. But the machine was fine (and still is for what we ask of it).

So .. do really like your Mac or PC or whatever? Does it do what you ask of it?

Your comparisons of later 68k and x86 members is fairly true, however, the earlier models are inaccurately linked.

The 68000 is a 16/32 CPU, whereas the 8086 is an 8/16 CPU. A better match for the 68000 would have been the 386SX (which is also a 16/32 CPU). It also has a 24-bit address size, so it can address up to 16 Mbytes of RAM, whereas the the 8086 can only see 1Mbyte (20-bits wide). The 386SX also has this 24-bit (16 Mbyte) memory range.

The 68020 is a full 32-bit (32/32) CPU, not a 16-bit (16/16) CPU like the 286. It should be ranked about equal with the 32-bit (32/32) 386DX.

(BTW: For those of you who may not understand what I mean by "16/32", and other such items in my text: it refers to data bus size of the individual CPU. The first number refers to the CPU-to-world data bus, whereas the second refers to the on-chip data paths).

Unless the Atari group used the same algorithm as the Alpha team, it doesn't
really prove anything. If it was an optimization fo the algorithm that was
responsible for the increase in speed, then the Alpha team can just as easily
use that algorithm to speed up their demo.

Unless we can control the algorithm, we can't be sure whether the increase
in speed is due to the hardware or the algorithm. If we aren't sure that the
alogrithm is the same then the demonstration doesn't *necessarily* prove
anything.

Maybe not, but in this case, at least, he makes sense. The Falcon030 is certainly not as powerful as the TT030, is it? And he is quite correct about where the PPC came from. What he neglects to mention is that it's next (or should I say NeXT?) to impossible to find native-mode apps for the PPC; running in emulation mode naturally reduces performance.

Raw "horsepower" of a computer isn't relevant to the end user, however; what matters is how efficiently the OS and applications /use/ that horsepower. As an analogy, if you owned both a Mercury station wagon, and a shuttle transporter (the device that carries the shuttle from the Vehicle Assembly Building to the launch pad), you would find it far more rewarding to drive the Merc to Safeway to buy a gallon of milk; the shuttle transporter is arguably the most powerful land vehcile in the world, but it has a top speed of about 2 miles an hour. It wasn't designed for trips to the corner store, and the Merc can't carry the shuttle to the launch pad. In the same way, a multi-processor Pentium Pro 200 makes a terrific file server - but it's clumsy and awkward for MIDI applications on the road.

Get the computer that does what you want, for as little money as you can manage to spend, and offers the minimum required features. There will be a new one next year that does it better and cheaper, anyhow - even in the Atari world. The difference is, in the Atari world, you'll be buying something designed by people who love their platform, and use it themselves in preference to other platforms. The same may probably be said for the Amiga. Everyone else is in it for the money, and little else.

If he has violated their AUP or whatever then fair enough but I for
one find it pretty sad that you want to get rid of him, he's never
put up a single decent argument against anything and although you may
find him irritating the fact is that none of the postings in this
group would be here without him. I've taken this group for about 6
months and can never recall a posting that was not connected to Pete,
and if they did exist then you could probably count them on one hand.
I know you object to his postings but if you don't like them then you
can probably kill them, I quite enjoy his postings it's very
interesting to see how some peoples mind works (or not in this case).
Wether you like it or not Pete IS the group.

>>* Can automatically format your document
>Ditto.

That's not correct. WordWriter ST didn't even auto-wrap text if you inserted and deleted text in a paragraph; you had to press an F-key to get it to reformat. In any case, that's not the feature that I'm talking about in Microsoft Word. Word can automatically make a document fit a certain number of pages that you specify, by adjusting spacing, margins, and so on. It also will automatically apply indentation, styles, headings, and so on, which is probably different from what you're thinking. Not that WordWriter ST is relevant here.

>>* Can be automated with its WordBasic scripting language, which is more
>> complex than ClarisWorks' simple macro facility
>
>Yet another version of Visual Basic.

I was not making any judgement on Visual Basic. I was simply stating that it is more complex that ClarisWorks' macro facility, which it is. Clarisworks allows you to record a sequence of actions and play them back, but offers no programming features.

>>* has an annotation system
>I can't honestly say I've ever used that feature.

Your responses above re: automatic formatting, as well as your comment below about its revision tracking system, suggest that you might not be familiar with Word. Have you used it?

>>* has a revision-tracking system to track changes to documents
>
>For people who don't know how to "save as..."

Uh... not quite. Does using "Save as..." log changes to the document in one file, along with the dates the changes were made and by whom, for easy viewing?

>>* has automatic footnotes and endnotes
>
>Back to WordWriter.

What does WordWriter have to do with this comparison? I'm simply trying to show that MS Word and ClarisWorks are not comparable programs.

>>* has index and table-of-contents generation
>
>Useful for writing large papers and books, not much use for the home/personal
>writer.

I wasn't making any comments on how useful the features were for home or personal writers. I was simply detailing a list of some features that Word has that ClarisWorks does not.

>>There are more features that Microsoft Word has that ClarisWorks does not; I
>>have not listed them all. Keep in mind that ClarisWorks is not intended to
>>be a heavy-duty word processor like Word. ClarisWorks is an integrated

>Precisely. Just as PhotoShop and PhotoLine have different target audiences.

That's the only point I was trying to make, in response to someone's statement that a previous poster had no basis for stating that ClarisWorks is not comparable to Word.

I'm not sure why you're bringing up Cyrix and AMD. What are the behaviours
that Cyrix and AMD are engaging in that Motorola is? This was probably in
an earlier article, and I've only been reading this newsgroup for a few days.

>>>   Admittedly, my views are merely the extension of the expectations

I don't understand why you are stating that the PPC604 has to perform just
as well as the 68060. Companies make lots of products, and they're not
all released at the same time, nor are they all equal in power or performance.
I don't see any reason why the performance of the 68060 necessarily should
reflect on the performance of the PowerPC 604.

Compared to the 88000 series?  (Which were a monumental marketing flop,
but that's another story.)

What information is this?  Could you repost this or mail it to me?  It would
be interesting to see.  Benchmarks would be appreciated.

Did you consider it misleading of Atari that TOS 3.0x and TOS 2.0x were almost
identical, except for TT support? O

Companies do this kind of naming chicanery all the time; it's not limited to
any one company or corporation. Any why should what Motorola names its chips
reflect on their engineering skill?

>cheap and easy as you seem to beleive.

Well VRAM isn't the only fast ram solution. You have the MDRAM of the
ET6000 cards which has an internal bandwidth of 720 MB/s, and the 2 meg
ET6000 cards can now be bought for less than US$150. The 4 meg cards
are coming out in a month or two, and the price of the 2 meggers will
drop even further. I had an ET6000 card a few months ago, and it
supported a sustained flow of 90 MB/s from the CPU. I had a directx app
writing 107 MB/s of 255-color software sprites with transparency to an
85 Hz screen double-buffered at 85 fps with z-ordering, and the math to
animate these sprites in real-motion type curves.

I've never seen an Amiga do anything like it. I've never seen an Amiga
do anything like direct3d, either. The other day I was watching
realtime ghourad shading on an 800*600 screen at 120 Hz, doublebuffered.
Makes TV look sick by comparison. Never seen anything like it on an
Amiga.

"Well can you record it to video with professional results?"

Why? It looks a hell of a lot better on the computer screen at
800*600@120Hz.

A good start would be http://quicktime.apple.com/. In there you should be
able to find a link to the QuickTime FAQ, which should answer any questions
you have about what QuickTime is and does. The Start Trek TNG Technical
Manual is an example of an early product that used QuickTime VR. A version
of Apple's 3D Metafile format has been adopted as an textension of VRML, if
I'm not mistaken.

>>"panoramas" -- you can look at a photorealistic scene, and rotate 360
>>degrees, around, up and down. Every major Mac developer supports
>>QuickTime. Many if not most multimedia CD-ROMs are QuickTime-based.
>>Sun Microsystems and Netscape both use QuickTime, as well as SGI if
>>I'm not mistaken. (I'm not sure about SGI, but I believe I read it
>>somewhere.)
>
>   So what?

You asked who uses QuickTime, and what they use it for. My response was
that many if not mose multimedia CD-ROMs are authored using QuickTime,
and the Sun, SGI, and Netscape all use QuickTime. Do you not consider that
to be a response to your question?

>[Tangent Deleted]

Actually it wasn't a tangent, it was a direct response to a question you
made.

In response to a previous posting by someone else, you said:

>>   Until you can even manage a point by point comparison of ClarisWorks
>>   and MSWord, you aren't even really justified in calling them un-
>>   comparable. You can't even compare these two rather mundane packages
>>   in any meaningful sense let alone anything else.

To which I replied:

>Some features that Microsoft Word has that ClarisWorks does not:
>* Automatically corrects spelling and typographical errors as you type
>* Can automatically format your document
>* Can be automated with its WordBasic scripting language, which is more
> complex than ClarisWorks' simple macro facility
>* has 100-level "Undo"
>* has an annotation system
>* has a revision-tracking system to track changes to documents
>* has a grammar checker
>* has automatic footnotes and endnotes
>* has index and table-of-contents generation

I think this is a point-by-point comparison which shows that ClarisWorks and
MS Word are not comparable. Do you disagree? How come you consider this
a tangent; is it not a direct response to your statement?

OK, you can call it an application if you want, but in this case the OpenDoc
people are trying to draw the distinction between monolithic do-everything-in
one-program applications and OpenDoc parts, which are tiny self-contained
modules that do only one specific task. If you don't like using parts of
Cyberdog, you can replace them with parts you don't like; you don't have to
use all or nothing.

```
>>Cyberdog is made of separate OpenDoc parts -- a mail reader, news reader,

ActiveX and the OLE technology on which it is based is a subset of OpenDoc.
OpenDoc-compatible software can work with OLE-compatible software. OpenDoc
is also regarded by many to be technically superior to OLE/ActiveX, and has
the further benefit of not being tainted by any questions of being proprietary.

>   Furthermore, if it's not some monolithic thing then why is it being
>   referenced as such? Unix has had internet functionality broken into
>   many small self contained parts for years. That is nothing new.

Cyberdog was being referenced as a suite, which is what it is. It is a
collection of OpenDoc parts which are collectively given the name "Cyberdog."

My point exactly! Of course an advocacy must refer to other platforms

but that reference should be within the context of Atari machines,
otherwise you are in the wrong place.

If the Atari team coded their demo as a "spur-of-the-moment response to a demo" on the Alpha, then it's highly likely that the two programs didn't even do the same thing. Perhaps the Atari team's algoirthm was the same, but they performed fewer iterations. Perhaps the Atari team's algorithm was slightly faster and they performed fewer iterations. Probably the graphics resolution and colour depth were different.

The point I'm trying to make is that one can't claim with certainty that one machine is faster than the other until we ensure that all variables except the hardware are controlled. Otherwise, we can't be sure that the differences in performance are due to the hardware rather than the software.

Which is still not a suitable file server.

And it's not relevant to Atari, either.

That's not true. Almost every application out there is available in both
68K and PPC-native form. There's even software that *requires* a PowerPC.

Style sheets is a feature that was not included , WWST, that's true. OTOH, in
all the years I've been using 'puters, I've never needed a style sheet - I'm
not a professional writer, I'm a software developer and lab tech.

IIRC, the person who made that statement is a well-known clueless lUser.

Claris is a nice suite - I prefer it to anything MS ever released. Comparability is only applicable if one NEEDS certain features that are in one package, and not in another. For an addtional quick example, Pagestream does everything I need in a DTP package, but Calamus SL is a far more powerful package. The difference between $40 and $400 is significant, however, at least to me.

I'm pretty sure. I used WordWriter for years. You had to use the "Reformat
paragraph" or "Reformat Document" commands. I later swtiched to Calligrapher,
which had quirks of its own.

>> In any case, that's not the feature that I'm talking about in

Um, it's not the same as style sheets. And the fact that you do not use
a style sheet doesn't mean that it's not useful to a lot of people, or that
auto-formatting is a not a feature that Word has that ClarisWorks doesn't.

>>>>* has a revision-tracking system to track changes to documents
>>>

Just because you don't use it doesn't mean that it's no an important feature for other people, or that it's "for people who don't know how to use Save As."

>>>>* has automatic footnotes and endnotes
>>>
>>>Back to WordWriter.

>attempting to steer towards the appropriate topic.

The topic was appropriate. Someone said that comparing Photoshop to PhotoLite was like comparing MS Word to Clarisworks. Another person responded saying that he was unjustified in saying that Word and Clarisworks are uncomparable. I showed that they are uncomparable, as you agree.

>>>>* has index and table-of-contents generation
>>>

>
>And I was commenting on how useful the features are. It's complementary to
>your feature-by-feature review.

Note that useful to you and useful are not necessarily the same. Lots of professional writers, and many others, find index and table-of-contents generation invaluable. There are lots of programs that I have that contain stuff that I don't use, or don't use often. That doesn't mean they're not useful, just that they're not useful *to me*. I'm sure there are features and programs that you use that others don't find useful. That doesn't mean that they are not useful features... remember that people have different requirements and needs.

>>That's the only point I was trying to make, in response to someone's
>statement
>>that a previous poster had no basis for stating that ClarisWorks is not

>
>IIRC, the person who made that statement is a well-known clueless lUser.

I don't know who it was, nor does it make any difference to the claim that
Word and ClarisWorks are not comparable.

>Claris is a nice suite - I prefer it to anything MS ever released.
>Comparability is only applicable if one NEEDS certain features that are in one
>package, and not in another. For an addtional quick example, Pagestream does
>everything I need in a DTP package, but Calamus SL is a far more powerful

>least to me.

I think the argument was that it would be unfair to compare two programs
such as Word and Clarisworks by saying "Word takes longer to load than
Clarisworks, so Clarisworks must be the better word processor." Lots of
people like ClarisWorks and use it, but that doesn't mean that Word is
not useful or is not good just because it's bigger and/or takes more time
to load. It doesn't matter if ClarisWorks loads faster if it can't do
something you need.

Your ignorance indicates fairly well that you have no business attempting
to inform anyone upon this subject.

BTW, the 060 is in fact a superscalar cpu with 3 execution paths.
So it does compare actually...

Is that really the best you can do? Besides, apple's sites are the
absolute slowest sites on the net. They're not useful for anything
even assuming they do contain any content. The sloth of apple sites
show the genuine uselessness of highbandwidth file formats on the net.

I was thinking more of somone like DEC or Siemans or McDonald-Douglas
or some ministry in thailand or whatnot.

So? What has that gotten you lately? A strategy game that looks like
it could have been implemented with a simple game-tree and a buncha
gifs? An encyclopedia that could have used cyberstudio *seq's? Write
a Cyberstudio plugin and 'scape will use SEQ just as much as it does
QT. (functionality)

>and the Sun, SGI, and Netscape all use QuickTime. Do you not consider that
>to be a response to your question?

For what? For something more than Cyberstudio was 8 years ago?
You have yet to show that. As of yet, they're just nice digital
video toys and nothing more.

No one expected any different. No one had any reason to expect any
difference. Furthermore, it is a domain which has no engineering
to speak of. Hardware is an entirely different matter. ISO9001 isn't
such a bold thing.

Either they compare (060 & P6), or Motorola gets a nice spot beside
Cyrix on the wall of shame.

Maybe you would like to explain what PhotoShop does that Photoline does
not?
Then, back up your statements with proof, meaning you must compair the
two
programs with experience that you gained first hand using both.
I honestly don't think you OWN Photoslop, but give it a shot. Demo
versions
of either don't count. As a matter of fact, I can do it right now with a
simple keyboard stroke. Let's use a 20mb Tiff for performance ratings.
Let's see how your 24mb of ram in your powersludge compairs to the 128mb
ram capacity of my simple machine. Better get that virtual memory turned
on.
I'll be watching your post to check for accuracy. My stop watch is
ready.
My filters are ready. Kia's don't count. Let's start the equivalency
test.

Hi everybody,

I got an old but running ATARI ABC 386sx portable and has only been able to attach a mouse to the one marked as "RS-232" serial port at the rear side.

Hawever, there is a small (Apple-ish) port on the left side of the
RS-232, which is marked as "mouse".

Well, I went at the local hardware store and bought an addapter in
the hope to be able to connect my 9-pin D-type mouse-plug to this small
port.

But..in vain...PC-CHECK and MSD are telling me that there is only one
single UART inside ???

Is this true???
What is this port for??? And why is it marked as "mouse" ???

I have no kind of documentation for the ATARY and will be extremely
greatful for any kind of help.

regards,
Stoyan

PS: forward a copy of your reply to my e-mail adress, because I don't
subscribe this newsgroup...Thanx

>Sorry, you were wrong ... it can and is ... right now!

Gary, it can't without a high-priced graphics card. And given that
all of those high-priced graphics cards are DRAM-based, it isn't
competitive, speedwise, with the VRAM-based PC graphics cards, which
are significantly faster at high resolutions and color depths.

I don't consider 724x484 to be high-res by 1996's standards. 1024x768
is a fairly normal resolution, and 1280x1024 is moving into the
"high-res" category.

It makes it easier to convert people. I still regularly run M$-DOS
because there's so much stuff for it that I use, and it's useful to be
able to access my M$-DOS partition when I'm in Linux (which, IMNSHO,
beats anything Bill Gates could dream up on his best days).

Are you stating that that the Mac OS is not polished and TOS is? If so, you are smoking some silly stuff.

Whats this processor time crap.. Who cares? Can your OS run Quicktime 2.5, VR, OpenDoc, Cyberdog and contain QuickDraw 3d?

When it does, get back to me..

>>Afford what? My system costs 1/3 of the Hades system, your money(TM: Bob Dole)

My net software is current..Thanks for caring..

Afford is an issue. My system's price tag was 1/3 of the Hades and is the issue. Plus it came with over $500 in apps, only Hades!

What's so great about CyberDog? I tried it, after downloading the 20M 7.5.3 update and the 3 disk 7.5.5 update, and downloading OpenDoc 1.1, enabling OpenTransport 1.1, and grabbing CyberDog, I finally got it working. Granted, I'm using the dead-standard browser and such, and the real power seems to be how you can arrange pages and functionality, but the standard mail/news/www clients are _horrible_. CyberDog's WWW browser is the slowest I've used in recent memory (no, I've used nothing on the Amiga lately...) and it's _really_ something that Apple's proud of this new technology. I think it will be interesting if and when plug-ins become commonly available, but until that time, CyberDog is, IMHO, to be avoided.

Machine used: 24M 6100/60. Netscape 3.0 runs, if not quickly on this system, then at least it runs.

The Mac is many things, but fast isn't one of them.

That's most likely a PS/2 bus mouse port. I have NEVER been able to get a bus mosue to work with an adapter on a serial port, and never gotten a serial mouse to work on the bus port. Solution: Spend US$10 and buy a cheap bus mouse. It will probably come with any required drivers.

They may be faster, but they cost more than the DRAM cards and are less common becasue of it. Speedwise, you need a fast (100MHz+) Pentium with a PCI motherboard to compete with Amiga or the new Atari clones when it comes to multi-media. This is not to say it can't be done; simply that it isn't as cheap and easy as you seem to beleive.

Aside: I know Michelle is gone - is Scott still throwing his weight around and reading "private" email on the board?

Because in order to make any inroads into the PC market, any OS has to support the existing customer base. It should also be pointed out that the 8.3 file system is NOT mickey$lop's invention - it was stolen intact from CP/M; the Win95 long filename system is more-or-less the same as the NTFS without the total incompatability introduced by NTFS; which is in turn very similar to the miniX file system.

Thus, I am suggesting that Apple do something that is both economically competititve, and supportive of the target customer base. This is called "marketability" - something Apple has neglected for rather too long, I'm sorry to say.

Ah. Well, in that case, we have the same thing on the ST using Teradesk and the WWW suite. I can install CAB as the app to launch when opening an "html" file type, and it will automatically launch and load; this is also true with the buil-tin GEM desktop on all versions of TOS starting with 1.04 (that's what, 8 or 10 years old?). This is true with all apps that can accept a command line argument for the doc file to load (most of the availaable apps will od that). The differnce, of course, is that Teradesk/GEM desk top are free, and the WWW package is donationware.

Subject: Petey the whine baby
Date: 1996/10/14
Message-ID: <3262F17A.40AE@ridgecrest.ca.us>#1/1
X-Deja-AN: 189733435
content-type: text/plain; charset=us-ascii

organization: RidgeNET
mime-version: 1.0
newsgroups: comp.sys.atari.advocacy
x-mailer: Mozilla 3.0 (Macintosh; I; 68K)

First, Petey complains that someone is
cancelling his post to the comp.sys.atari
newsgroups. It was nice while it lasted.
My system adminstrator recommends that we
elect a moderator for our newsgroups that
can "legally" cancel any unwanted messages
to these newsgroups. This would be through
the usenet bunch. I don't have any idea how
to do this, but someone (he,he,he) in our
newsgroup does know how. The question is would
they be willing to register with the usenet?

Secondly, my system adminstrator received
a complaint from Mr.Sinplop (and i'm not
quoting this, so it's ok for me to post it)
that I spammed his email with sixteen of the
same messages. I can see that Sinplop didn't
bother to read all of these. The emails consisted
of the recent post to the atari newsgroup concerning
something about new Apples (I actually didn't
read the 100k article as I do buy Mac
World). All I did was reply to his post and
quote the needlessly large article. Each mail
was unique, with different text, and a quote
of his original post for reference.
Now all I can say is that you might have some
idea of how the users in this group feel when
they have to download and read these articles
off line containing nothing but thousands of
wasted bits with you sorry arsed name attached to
the file.
But honestly, sixteen messages? I would never
have that much to say to you, Mr. Sinplop. Maybe
it was an error with my machine. It is a Mac you
know :)

Mike

The internet accessories that Viscorp's head of Software called not upto snuff.
Considering the $450 price does not include a HD. Can you get a 1200 in NA,
today? I don't think so..

The $450 Newton 120 is more capable of internet than the A1200.. Nice try..

I don't need to think so, I know you can get brand new A1200's. Try Devine
Computers
or Software Hut. There's even a local dealer near where I live that has them.
You really need to take your head out of your ass and just take a peak around.
There's a whole "real" world out here.

Wow! You mean the PowerMac version of PhotoShop has features that the 68K version has not? Quite incorrect, it is just optimized for the PowerPC, much like Amiga software is often optimized for the 68060 or 040.

>Give it up!!!!!!

    Why not? Have you got a lot of money invested in Dec hardware or
    something? Will some part of you shrivel and die if it realizes that
    there may be something that a Falcon can manage better than an alpha?

    There are some very particular things that the Falcon is capable
    of doing very well. There are also some things that it can do
    extremely well if the task allows the proper use of it's onboard
    56K DSP. It is in such tasks that a Falcon has managed to equal
    an alpha.

    Until you can even manage a point by point comparison of ClarisWorks
    and MSWord, you aren't even really justified in calling them un-
    comparable. You can't even compare these two rather mundane packages
    in any meaningful sense let alone anything else.

Yeah, on a PC with Win95 you NEED the speed.
Anyway, SCALA runs circles around Powerpoint when it comes to smooth
presentations. M$ sucks big time. A p133 with 16megs and a S3-trio 64 PCI
GFX card and WIn95....hmmmm....After I gave a demo with Scala the audience
went completely wild. "Wow, that must be a FAST computer......"
Yeah, 14mhz 68020 and an AGA chipset......

Ah well, who cares.....I am happy....They weren't....That's what counts!

....And back they went to the rest of the crowd, trying to squeeze some
more out of their Win95 machines.....

Given that the Amiga 4000 costs $2800 or so, I find it amazing anyone
can even debate costs in this.

Atari clones? Like what? From who?

List of them, please?

For those unaware, CyberDog is a set of slow, buggy, incomplete Internet
e-mail and web browser apps, with a browser slower and less capable than
CAB. It's sole claim to fame is its ability to interface with OpenDoc.
WWW141 is more capable - but it's free.

I have never used an Amiga, owned an Amiga, or had any interest in an Amiga. And I decided to test the validity of Petey's statement about inavailablity of them. I walked down to Barnes and Noble, grabbed one of the Amiga rags, and called some of the mail-order companies in them (the same method that one has to use to get Mac equipment). Not only was Amiga equipment and systems available, it was considerably cheaper and easier to purchase and buy than Mac stuff. And the salespeople had a clue about what they sell, unlike most of the Mac sellers.

More proof that Mr. Sinclair is a do-nothing know-nothing.

Why shouldn't it be? The 680x0 line has always been ahead of the 80x86 line. Are you suggesting that the company that produces the core logic for your very dear machine has somehow faltered? In the same breath you tear down the 68060, you tear down the PPC604 as well. As always you do so without the slightest information.

Admittedly, my views are merely the extension of the expectations provided by the rest of the 68K family. However, such expectations are required to give the PPC's any legitimacy. For both reflect upon the same company, and in the end each other.

You may try to prove me wrong any time you are up to posting more than just empty rhetoric.

OK, Peter, you had your chance. Now, here's the bottom line: Within the past week, you posted a comemrcial advertisement here, in direct violation of the charter of University of Northern Iowa. You placed your university's status as a non-profit educational institution in dnager. You have alos refused to stop posting personal attacks, even though I offered the olive branch and suggested that a sharing of knowledge would be more productive than the constant flames that your activities have generated in the past.

Now here's what's going to happen: EVERY user who is tired of your crap is going to send email to postmaster@uni.com, quoting the entire following section, and explaining that commercial advertising is a violation of the university's charter and endangers their tax-free status. If your sysadmin still refuses to curb your activities, then the /real/ university adminstration can take it up with the IRS.

The following is the message that will end the career of Peter Sinclair-Day, Macintosh salesman:

Introducing the MPOWER line of Mac OS compatible personal
When we asked our customers what they wanted in an Apple Macintosh compatible clone computer, we weren't surprised to hear that most of them wanted two things: great performance at a great price, and the ability to order the system they want, with the drives, and other options they need, but without a bunch of "features" they neither need nor want. The APS MPower series of personal computers is designed to accommodate both of these requests. Priced hundreds of dollars less than systems with similar performance and features, APS MPower systems deliver the exceptional performance of Motorola's 603e and 604e PowerPC processors. APS MPower systems offer a staggering array of storage and peripheral options - and why not. APS Technologies is the premier supplier of storage and backup products to the Macintosh market. Our "Build Your Own Box" option lets you configure your own system with an astounding amount of flexibility.

The Best Engineering - Motorola

When we asked our customers what they wanted in an Apple Macintosh
- Motorola - manufacturer of the PowerPC processor &endash; no one knows it better
- MPower takes advantage of Motorola's quality processor technology, innovation & reliability

The Best Service and Support

- MPower comes from the company you've known and trusted for years
- MPower has the backing of APS' award-winning service and support

Exceptional Value

- Best mix of advanced processor technology and high-quality

Whenhardwared our customers what they wanted in an Apple Macintosh
- Compared with other personal computers running Mac OS, APS' MPower gives you the most for your money

Most Configuration Options

- APS, the recognized leader in Mac data storage solutions, has the hardware that you want included with your next Mac OS system - hard drives, removable media devices, and tape backup systems

APS MPOWER 603E160 $1399

Wh* The best value in PowerPC computing!nted in an Apple Macintosh
* 160MHz Motorola PowerPC 603e processor
* 16MB of RAM
* Three available PCI slots and two available 3.5" drive bays
* 1.2GB hard drive

5

* 8X CD-ROM

* Monitor sold seperately

The new benchmark in PowerPC, Mac OS computing, the APS MPower 603e160, for under $1,400, is the value leader in RISC-based workstations. The perfect home, or mass application PowerPC computer includes a 1.2GB hard disk drive, an 8X CD-ROM, and 16MB (upgradable to 160MB) of RAM. The APS MPower 603e160 includes a mouse, ADBtosh keyboard, three PCI expansion slots, and two available 3.5" drive bays. One-year limited warranty.

APS MPOWER 603E200 $1599

* The ideal mix of performance and value
* 200MHz Motorola PowerPC 603e processor
* 16MB of RAM
* Three available PCI slots and two available 3.5" drive bays
* 1.2GB hard drive
* 8X CD-ROM

* Monitor sold seperately

7

Outstanding performance at a terrific price, the APS MPower 603e200 is the bang-for-the-buck system of choice for individual and institutional users alike. Powered by Motorola's 200MHz PowerPC 603e processor, the APS MPower 603e200 comes ready for action with a 1.2GB hard drive and an 8X CD-ROM. Run most applications in the installed 16MB of system RAM (upgradable to 160MB) and enjoy the exceptional performance afforded by the 256KB of Level 2 cache and 1MB of VRAM. Three PCI slots and two available 3.5" drive bays let you add a whole range of PCI card and peripheral options. With the included mouse and extended ADB keyboard, this is the value-priced performance system of choice. One-year limited warranty.

APS MPOWER 604E200 $2599

* High-performance mini-tower PowerPC system at an exceptional price

- Blazing fast 200MHz PowerPC 604e processor
- Five PCI slots and four available drive bays

- 2.5GB hard drive
- 8X CD-ROM
- 24MB of RAM

- Monitor sold seperately

Blinding speed and exceptional value set this high-performance PowerPC, Mac OS workstation firmly at the top of the heap. The APS MPower 604e200 comes equipped with a gigantic 2.5GB hard disk drive, an 8X CD-ROM drive, and 24MB of RAM (upgradable to 160MB of EDO DIMM RAM) - and that's just for starters! Turbocharged with 2MB of VRAM and 512K of Level 2 cache, the APS MPower 604e200 includes five PCI slots for video, networking, peripheral expansion, and other PCI-based cards. The roomy mini-tower design includes four available drive bays for optimal customization of the high-performance MPower 604e200. One-year limited warranty.

<See dejanews for details>

In the first place, Glen, I never stated the clock speed of the Alpha - in fact, I have no idea what speed it was running. However, the evidence is available for anyone who is interested in the truth, rather than MCIBTYC posturing; the demo in question took place at a largish computer show in Germany in, I believe, 1992. The reason the Falcon outperformed the DEC is

that the Flacon's design is optimized for multimedia; the DEC box was
optimized as a file serve, which is a usually a poor configuration for MM
apps.

So, if you want the truth, go look it up. If, on the other hand, all you care
about is starting more flame wars - go to Hell, I can't be bothered.

In addition to that, Oregon Research happens to be a few blocks from my
apartment - they stock and sell software for both Atari and Amiga, and I'd bet
a nickel I could buy an Amiga from them, as well.

The point is moot, now that sinclap has jeopardized his uni's tax status, however...

So, you actually ordered from these Amiga mailorder firms? Did you order from Safe Harbor or Software Hut. Thats interesting, I had a different negative experience when I ordered from Software Hut. My A1200 arrived banged up in a mangled box and took for ever to replace.

Did you actually order or are you talking out of your ass?

So you ordered from Mac mailorders before? I never had difficulties with the big three...MacZone, MacWareHouse and MacConnection. Order before 12am, and recieve it the next day for $3(software)... There are Mac mailorder dogs such as CompuD...

Interesting I had the opposite experience and I am a Mac owner and was an Amiga nut at one time. I still have a heart for the Amiga and was a swell machine in it's time. I am keeping my eye on the BeBox and the OS. If there are cool apps within the year, who knows.

I wasn't aware that the Amigas were cheaper than the Macs and Pentiums.. The only Amiga available in NA is the $2800 040-25mhz A4000T new. Apple doesn't make 040 Macs today...So, why did you state the Amiga is cheaper. In many categories of software there is no Amiga equivelants.

I remember that! The Atari group watched the demo that the Alpha team were doing and upstaged them by running the same demo on the Falcon but faster!!! Its the truth! Righteous!!! :)

Ever heard of QuickPak? There are various places in North America that
you can get the A1200 (new) and for as low as $450.00...Cheer up, though
maybe you'll get something right -one- of these days... :)

THANK GOD we _*DON'T*_ have "office" on the Atari platform.
It would be interesting to see how Spectre GCR does on the Hades/Medusa or
DirecTT40/60 in comparison to a PowerMAC. Qu;est-ce que tu pense Chris?

>own serial standard is no barrier hooking one to mine..

Of course you would take this attitude with a Mac. In this respect, Mac's have less support than even the orphaned Atari's and Commodores. You don't have any real retail options when it comes to modems, whereas we can just walk in and find aisles of them awaiting us. We can pick and choose as our needs dictate.

We don't need options forced upon us because of pathetically poor retail support.

Then you've just admitted that your recently purchase machine has been pushed into obsolescence as soon as you bought it. This makes it somewhat of a waste. You blew nearly a grand on wha event you admit to be a dog.

>Typical Jabba.. We don't have it but others do and it's wasted bandwith.. Now

I have access to a T1 connection. I still consider it wasted bandwidth.
On anything else, one will just get bored with insufficient thruput after
a time.

I have seen the so called 'promised land' and I am here to tell all of the
other Atarians that it is nearly completely hype. They're not really
missing
anything with CAB or even Lynx.

>its like stating all those Sports Utilities just waste gas and risk lives in
>the Middle East..

A truck-class vehicle can actually deliver quantifiable gains.
You have yet to sufficiently quantify the gains of your so called 'progress'.

BTW-most sport utility vehicles are just rehashes of 50 year old designs.

You couldn't spot real progress if it came up and bit you on the nose...

In the microprocessor manuals.

pipelining: 030 vs 486
L1 cache: 030 vs. 486
32bit registers: 68000 vs. 386
16bit external bus: 68000 vs. 286
Flat addressing: 68000 vs. 386
16M address space: 68000 vs. 286
64G address space: 020 vs. 386
Historically better FPU performance.

Those are just the less philosophical nits.

[deletia]

At which point you are nearly in the same condition wrt support as you are
on an Atari. Linux (and FreeBSD) are irrelevant because they have 68k
counterparts. Although, they are not much of a benefit on either platforms.
X is as much of a dog as any of the Windows are when it comes to resources
and applications support is rather spotty. (a.out or elf/motiff or xfree/no one's
written that driver yet...) Don't even bother with Solaris, SCO or NeXTStep. They
are priced way out of range of any sane consumer. QNX is just plain obscure.
You might as well run OS/9.

To be honest I can't post "verifiable" proof, although the above statements have been considered valid in many "techie" circles...BUT I do know that my Falcon 030 running at only 16mhz feels -much- more responsive in normal, day-to-day use (especially everything from the the desktop) than the Pentium 90 (mhz) that we have at work running Windows '95...Strange, huh? I can just imagine how a Hades or Medusa would feel next to a Wintel machine running at the same speed...Makes me feel kinda sorry for them...<grin>

The middle of the line PowerMacs are from $2000-$2500 from Apple and less from the Mac clones..

Top of the line Macs with 604e at greater than 132mhz start at $3000 and much less on the Mac clones.. PowerComputing is selling the middle of the line called PowerCenter with 604e starting at $1900 for the 132 mhz one..

Last I heard, the hades was $3000 or more... Task oriented projects is hogwash when it lacks many of the apps that users on the other platforms take for granted..

Nothing to brag home about it... Considering that PD software on any platform flies.. Real world Apps is key..

>> I am sure you were using the same software such as Office on both machines..
> THANK GOD we _*DON'T*_ have "office" on the Atari platform.

Actually, I dumped Office from my box due to the poor job by MS.. Office is a snap on a Pentium 200 and proves the point that MS intentialy has crippled their apps on the Mac market. Office is great on a PC...

Not really relevant, John, I just think if we're going to advocate our favorite
BBS software, we ought to do it where the majority of readers don't have to wade
through it to get to what /they/ want.

Incidentally, if you're looking for a really offbeat door gaem, try Cows! by Joe
Blenkle. He frequents c.s.a.8 so you can still get a key for it.

Don't waste your breath on Sinclap, Chris, I am as of now proclaiming the UDP
upon him; hereafter, any thread in any *atari* group with his name in it as a
poster will be relegated to the world-wide bit-bucket.

He can go annoy the people in the *amiga* and *pc* groups as much as he likes,
though. Of course, his sysadmin will then be DELUGED with complaints, but

that's his problem.

Okay Pal!

You will probably say "Bull Shit" or some other explanative that shows your mental maturity...but... here are a couple.

Drag a 20Mb TIFF onto Photoshop on a PowerMac 9500 with 32Mb of RAM and tell me how long it takes to load Photoshop and display the file...

An equivalent Graphics package called PhotoLine on the DirecT60 takes less than two seconds.

Now, run the emboss filter on both. The DirecT60 performs the function in under 3 seconds.

All of the other filters take less time than this.

Obviously you don't have a 9500, we do and the times are 5-6 as long for loading and the filters take 3 times as long on average to perform on the 9500.

I could go on, but what is the point? You are not going to buy one or admit that it is a fast useable machine. You are happy with what you have and so be it. Our users are happy with what they have.

I just can't stomach your uninformed opinion being presented as fact.

Hades sells for under 2500.00 US, I don't know where you got your price from.

Send you one? Send me the money and I would be happy to.

Desktop responsive such opening/closing windows and processing power are two separate issues. I will wager that Photoshop on a lowend PowerMac will toast any 060 machine..

> You don't have any real retail options when it comes to modems, whereas
> we can just walk in and find aisles of them awaiting us. We can pick and
> choose as our needs dictate.

Puleaze....What retail options are you referring to? You are full of BS as usual. I have not seen one iota of Atari and C= stuff in stores for at least a decade. Best Buy and the other super retailers stock modems and other accesories for the Mac. Not a burden. And if for some reason your retailer does not have what you want pick up a MacWarehouse catalog and recieve it the next day..No fuss involved..

Mac Performas shipping today include a 28k modem..

> We don't need options forced upon us because of pathetically poor
> retail support.

Who is forcing options on whom? Thats why Apple has two Mac brand line....The Performas for the home users and first time buyers which includes about all the options as standard. And the PowerMac flagship line for those who want to customize their system. Apple knows more about their customers(most of the time) than you do..

> Then you've just admitted that your recently purchase machine has been
> pushed into obsolescence as soon as you bought it. This makes it some-
> what of a waste. You blew nearly a grand on wha event you admit to be a dog.

I purchased my Performa because of the price/performance ratio. $899 with a gig HD, keyboard and software bundle was to hard to resist. I was on a budget and this close out model fit my budget. Plus the internal 4x CD was ice caking..

>>>
>>>   You really can't have it both ways.
>>>
>>What both ways?
>
>   You really are quite illiterate for someone who 'works' in a
library.

You are quite the Ferengi way of reasoning..

I guess Peter has finally fallen off the edge of sanity (he's always been a bit precariously balanced, apparently). Last night, I got 2 messages from him at home, and today here at work, I got yet another. I have repeatedly stated that I would publish flames (or that I might - same thing, really), and certainly Petey Boy knows I don't want to hear from him.

To outline the situation: He's gone paranoid, and seems to think that "imposing the Usenet Death Sentence" means something other than "you're consigned to Coventry" (or "we're all going to ignore you now, Peter"). I only wish it did. <SIGH> However, for the amusement of anyone who gets his jollies from such things, here are two of the messages; one from last night, and the one he sent to me here at work.

...when it comes to modems...

When it comes to modems, PC's, Ataris and Ameobas have always been
interchangeable. A Mega4 ST could use the earliest US Robotics Courier
Modems and can use the new sportsers as well, as well as any other
RS232C PC modem ever made...

This is an advantage of not uneccesarily bucking the standard.

Unlike macs, Atari's don't need a big fat "It's made for your machine"
label on it.

>accesories for the Mac. Not a burden. And if for some reason your retailer

4x CD is only iceing to a Mac user. The rest of the ATA world will just get
by with our better, cheaper, non-forceable options...

What's the word on Falcons and ATA CD rom drives?

Also, price/performace ratio then doesn't do anything to deal with the fact
that it is a dog now...

Applications are NOT the OS. You haven't the slightest clue as to where
this distinction lies. Admittedly there are some tangible differences.
However,
you have yet to mention any of them. The best you can do is come up with
a few applications and an api spec. or two.

>
>> You really are quite stupid in that respect.
>
>Me...A pig headed ferengi in that respect..

It is not Ferengi to understand the distinction between applications, that
are overhyped at that, and the OS. This doesn't make me Ferengi: it makes
me more literate.

You only serve embarass Apple with your inept advocacy. Many more do it
much better. You should leave it to them.

>
>>>> So, what useful things have you done with your multimedia TOYS

>Explains why he is getting whipped in the ratings...with Jay....

Actually, David is a rather avid Mac user. It just goes to show that all of your
'kind' aren't sucked in by hype.

Actually, that paraphrase was a response to a comment made to him that your
comment could have been a paraphrase to. The response was to Bill Gates....

As far as ratings go: they are the sort of thing that you should steer clear of, for
they make your advocacy look weak.

For Macs are loosing the 'ratings' wars...

>So you are speaking for all? I disagree. I find it quite visual and opens the
>door for other kinds of utility -educational wise..

It is an inefficent medium with with to deliver and mission critical information.
It is really quite stupid to limit one'sself to 10BaseT or even 100BaseT speeds
when one can go quite a bit faster. This is assuming that you're lucky enough
to have a T1 or an ISDN. Both are rather expensive, even if your organization
doesn't have limited resources.

Anything slower just wont cut it. Unfortunately, 'anything slower' describes
the very vast majority of network connections.

This appears even more absurd when one considers that delivery mediums
with necessary thruput are quite common now. Too bad people like you
don't want to use them.

>
>>

         We have a similar outlook when it comes to computing. Rich and company
         can be relatively sure that my observations will be more relevant to them
         than will be  yours.

>
>>         A truck-class vehicle can actually deliver quantifiable gains.

designs.
>>
>>         You couldn't spot real progress if it came up and bit you on the
nose...
>>
>Typical ferengi thought..

              Jeeps & trucks have been around for quite some time. They just
happen
              to be a fad these days. Jeeps have been around since the 1940's and
              the cherokee/wagoneer/suburban type vehicles have also been around
              for at least 20 years and share most characteristics with trucks
that have
              been around for much longer.

              Once again, you let yourself get sucked in... into the hype...

               Ferengi, coming from you, is actually complimentary.
               It implies a pragmatism that you do not posses.

One thing I forgot to mention - since Peter is in my killfile, I don' see his postings anyhow. Seems a bit odd that I would "delete" them if I can't see them. Of course, he ought to know (no, strike that - he's demonstrated a total lack of knowledge on almost every subject)... Well, everyone else here ought to know that it's not possible for me to "delete" his messages any more than I can take a book out of the library he sweeps up.

>I will wager that Photoshop on a lowend PowerMac will toast
>any 060 machine..

This is a pretty bold wager, you have not seen this machine and what it can do. I would be a little more careful with my wagers if I were you.

We have tested a 9500 here as well as PhotoShop running in Native Mode and the T60 with PhotoLine and/or DA's Repro runs circles around it without breaking a sweat. PhotoLine does not have as many features as PhotoShop, but it has all the necessary features, so it should come as no surprise that it is faster running code. DA's repro is more advanced than PhotoLine in many ways, and it is much faster as well.

This is all from experience.

Apple is in deep do-do and the industry does not expect them to survive as we know them today. Sad news really. The last press release from Apple is only going to hurt them more. They are now looking at Fall of 1998 for a full 32 bit preemptive multitasking OS upgrade. They are so far behind the times...

I can do that on my Powermac. No mess, nor fuss. I just added a 16 meg sim and two minutes to install.

An Amiga that can't do much today. Most Amigas are low res ones. Actually I keep my machine on all day. When I come home just load up Netscape and cruize in all it's glory..

Yep...Thats how I would describe the Mac community today. Funny thing is that
I can't find an Amiga user locally anymore.

Funny, right before this posting I read one from Computer Direct that
stated the '060 Atari using PhotoLine blew away a Mac 9500 that was
using PhotoShop...Huh, what about that... <grin>

The Falcon may feel more responsive when opening up windows. etc..However, the processing power on the Pentiums when using real equivelant apps on a Pentium 90 which is considered antiquated today will eat the 16 mhz 030 Falcon.

First of all I agree with Paul that this does not belong in an Atari newsgroup at all...Bored today, were we, Mr. Sinclair? :)

Second, the Amiga -still- exists...it did not end in 1994. (perhaps you are referring to Commodore?) There are millions of Amigas in existence...(although, like Atari, I don't have any idea how many are actually still being used) They are still pretty awesome machines, having the best integral, core multitasking anywhere...I much prefer the user friendliness of TOS/GEM but like Atari's, the Amiga is also pretty effecient with its system resources and does not require tons of RAM/CPU speed/hard drive space, etc,...unlike Macs and PC's.. :)

Look at the first paragraph -again- and follow the point of the thread,
Mr. Sinclair...point being not how a 90mhz Pentium would "eat" a Falcon
but that an '060 equipped/TOS based computer would match up very well
indeed with comparable Pentiums... :)

Oh, BTW, I think that running "real, equal apps" such as Calumus SL,
CAB, Cubase Audio, Apex Media, etc, etc, (long list dude) on a Falcon
is very comparable to "real apps" on a 90 mhz Push-me/ho-hum er, Pentium!

<heh>

Now you state that Photoline does not have as many features as Photoshop but
with all the necessary features to be compared with Photoshop. Sounds like
doubletalk here.   Who decides what is considered necessary features or the
ones that Photoshop has and Photolite does not have..

MacPublisher has two thirds of the features as Pagemaker and in my own opinion
is more responsive than Pagemaker.

> far behind the times...

Apple was in deep do-do months ago due to some stupid mistakes on the part of the previous management and the press fud. The industry has been predicting Apple's demise for twenty years. Under the new regime, the financial house is in order and more focus direction in their strengths. Plus Mac clone firms such as Motorola, PowerComputing and Umax will expand the market.

I went to a close door Apple briefing yesterday but can't divulge in what was discussed due to signing a legal document. However, keep an eye out at Cupertino in the next weeks to come..I came away impressed..Apple did state that they were doing very well with their high end line..

If you want an inkling in what is comming soon, check out 'macweek.com'
..Awesome issue!

But we don't HAVE to add that 16 meg simm you had to add to just get
functionality and that is the point I am making. Good try, but alas ...

>> button strip and the screen lights up at home.

PS> An Amiga that can't do much today. Most Amigas are low res ones.
PS> Actually I keep my machine on all day. When I come home just load up
PS> Netscape and cruize in all it's glory..

Oh, please ... my 3000 runs high-res laced and so do most of the others out
there. As far as internet, we have IBrowse, Aweb, Alynx, AmFTP, AmIRC and a host
of news readers/mailers. We aren't hurting in that dept and no giant
iconoclastic corporation programmed any of those for us. That was all done by
our hard working, ingeniuos programmers ... on their own, usually in their spare
time, at thier own homes. Pretty awesome feat when it causes guys like you to
come here and try to talk about how 'great' Netscape is in comparison!! I don't
miss anything you have Pete!

>> An Amiga is that kooky bunch of friends you have made from all over the
>> world who are friendly, helpful, willing to offer advice to anyone who
>> asks. An Amiga is all those pd/shareware/commercial programmers who not
>> only give us their talents, but their time and expertise as well. An Amiga
>> is the feeling of belonging to a special group of people unlike any you
>> have ever met for their openness, their compassion, their willingness to
>> engage in debate and to assist with the most mundane of problems.

PS> Yep...Thats how I would describe the Mac community today. Funny thing is
PS> that I can't find an Amiga user locally anymore.

If it wasn't proprietary, I'd be happy to send you a listing of Team Amiga
members worldwide that would part your hair (if you have any left after having

```
to deal with that Mac all day)? Our user base may have dwindled somewhat, but
those of us who are left are a special breed of people not matched in other
community. And, that, I'm sure is why you are here so much. Pity is that you
have gained nothing by osmosis ... though we all here keep hoping.

>> An Amiga is like the amendments to the US constitution, without us pushing,
>> correcting, cajoling, debating, protecting, defending, arguing, even
>> fighting for what we believe in ... where would mainstream computing be
>> today?

 PS> I wouldn't go that far with the Amiga.

Oh, I definitely would. The Amiga is what spurred on the likes of M$ and Apple
to get where they are today. Damn shame it took them 10 years to just catch up
to my old, dying, derilect of a computer ... an Amiga 3000/25.

>> It would be an 8088 ...      Viva la Amiga!!  Viva la Amiga Consortium!

 PS>|   Peter Sinclair-Day

Brilliant argument.

>Now you state that Photoline does not have as many features as Photoshop but
>with all the necessary features to be compared with Photoshop. Sounds like
>doubletalk here.   Who decides what is considered necessary features or the
>ones that Photoshop has and Photolite does not have..

No, This is not what I stated. This is not double talk. I merely put the test into perspective. Photoshop is bigger and slower
code than PhotoLine. PhotoLine does not have all the features of PhotoShop. The statement was made in order to clarify that this
should be taken into consideration. For somebody who works in a library, you don't read so good.

There is no easy way to compare a TOS compatible with a Mac OS compatible since we are talking two totally different operating
systems. The MacOS is bigger and slower code than TOS. Atari software is much more optimized than Mac software, it executes
faster and uses less overhead. This is why an 060 running TOS and Atari software is so fast. The PPC is definetly a superiour
chipset than the 060, no doubt about that. The MacOS and software slows it down though. This is the real issue here.

>Cupertino in the next weeks to come..I came away impressed..Apple did state
>that they were doing very well with their high end line..

You must impress easily.

The function being compared is all that is being debated, this is a
proper task that is completely integral to the working of a graphics
program. Back to the old car anology again you can't say that the F40
is a less powerfull car than a Ford Fiesta just becuase the F40 doesn't
have intermittent windscreen wipers and 5 seats.

>>

If you meant to type 'then', then it's hardly a fair comparison, is
it? Ho much was a 9500 back then?

>> Send you one? Send me the money and I would be happy to.
>>
>
>Why?  You made claims..

Yeah he made claims and you haven't seen the machine and keep
disputing the claims, there's no way you'd buy a machine because you
couldn't admit being wrong. Would you send me a 9500 is I said my ST
was more powerful than it?

All of Photoshop is most probably unnecessary in most cases.
This is why all the bruhaha about OpenDoc (which you don't
understand) and to some extent OLE.

>>
>> An equivalent Graphics package called PhotoLine on the DirecT60 takes

This is quite a lame response. You don't even really know what you

are arguing. This is to be expect as you never do know what you're
talking about.

If an 060 machine cannot compete with 686's and 604's then that should
be considered anamolous, no the other way around.

[deletia]

Why not? That is quite an ordinary price for that class of machine.
686's and 604's go for the same amount of money or MUCH more.

If size is that important to you David, that's 16368x16368 at 16 colors. But who
needs a screen that big anyways?

To some of us 'size' isn't important, ours is already as big as we need it to
be.

I got a nice apology from Peter yesterday and we've had a civil dialogue in email since then. I'd like to suggest that we try to give him an opportunity to be a positive contributor to this conference (rather than the flame-bait that he has been). While he can be confused about what's OS and what's applications from time-to-time, he's hardly got a corner on confusion <G> and I don't know anyone who's never made a mistake, yours truly included.

So let's see if Peter will be willing to give us all a chance to make a friend of him - after all, we as Atarians have more in common with Mac users than we do with "PC Pukes" and it's often useful to get another approach to any problem or task - we all know that, while it's not /our/ choice, the Mac is a pretty nice machine in most cases (let's ignore the Performa that was sold by WalMart).

What I suggested was that we stick to the the "this is what I like" or "this is how I do it" approach, rather than the MCIBTYC routine that's been the rule here in the past.

And let's try to avoid the ad hominem attacks that most of us have been guilty of in the past. They certainly don't contribute much to the flow of useful data.

I won't be putting my money into a Mac, but I sure don't mind seeing how they

do the things I do - I've "borrowed" more than one idea from Mac in the past.
<G>

>DirecTT40/60 in comparison to a PowerMAC. Qu;est-ce que tu pense Chris?

Hi Ken,

Spectre will not work on the Hades or DirecT60 for two reasons,

1-) It never worked properly on a TT

2-) Hades/DirecT60 does not have a cartridge Port.

All the best,
Chris

You are forgetting though...I use all that stuff, at least try to when my Mac doesn't crash.

I have Macs. I use Macs. I know Macs. I am aware of evrything that Macs can and cannot do. I prefer the simplicity and stability of Atari thank you very much.

We have run test on Calamus SL on DirecT60 and compared them to the same
tests on Pentium running Calamus on both Win95 and NT and well... the
DirecT60 is faster.

Calamus NT and 95 is the fastest DTP package on the Pentium.

All the best,
Chris

Sure Peter! Sure! The little extra time a Falcon uses on everyday
use compared to a 90Mhz Pentium, it takes back in slick interface! My
Falcon boots in 18! seconds. My wordprosessor use approx. 5 seconds to
load and it's a hell of a lot faster to use than ANY, I repeat ANY windows
word-prosessor I've ever tried, and I've tried a lot!
That's what I love about Atari computers! It feels like driving a
sportscar, and even though the engine is not as powerful as those found
in the PC trucks, I get from A to B just as fast, and often faster!

Eh... Too many exclamation marks, or?

> GREETINGS..

Greetings to you too, Peter!

Best regards to you all!

Geir...

If the Mac's can't keep up with the simple stuff, it's rather absurd
to think they'll keep up when real work has to be done.

newsgroups: comp.sys.atari.advocacy

Hello-

I'm looking to sell an old Atart 2600 and cartridges. I know this isn't worth much, but can nayone point me to a Newsgroup or web site that offers a price guide? Thanks a lot!

-Jeff Edwards

After reading Sinplops post concerning the model Mac he purchased, I must really question his sanity. No one, I mean no one would purchase a 7XXX series Mac that wanted to USE Photoshop. This indicates that he must not own the application or enjoys jerking off while he is loading a 20mb tiff file of some thin peckered kid that he admires at his state provided home. What does the pic look like on your machine over 1024*768? Like shit i'll bet. I know you didn't spring for a video card. It would cost you more than your Mac did, dickhead. Only have 16mb? So your running virtual memory just to load the 20mb file for compairson. How many extensions do you have to disable just to attempt to load it? Does you hard disk sound like a broken music box? Notice your mouse gets jerky (guess it could be your other hand whacking the old Iowa Corn stick). Can't select other windows during the process? Get real, to many of us use Mac's every day. We know what they can and can't do. Keep your bullshit for your first employer, you will need it. Yea, virtual sucks on the System O/S. Oh, yea, wait for BE, wait for BE. Copland's comming, Copland's comming. Ya, and so are United Nation owned parks in the U.S., that surely isn't a good fu**ing thing either. Maybe some of your political favorites will get elected and they will do to Iowa what they have done in California and Utah. They will fence off all of your farm land and restrict travel to foot only. You'll be in trouble, as you have one foot stuck in your ass now.

(Room for SinPlops comeback here)

Just a no name little dick that likes to stir up shit in someone elses home.

(more wasted space)

When you get to your final goal of waste management

personnel, i'll be sure to flush a big turd to
you.

(Somebody give this guy a mouth dusch)

Mike

He,he! Sorry! This is what I should have written:
"My Falcon boots in 18(!) second."
Or maybe, more correctly this:
"My Falcon boots in 18 seconds!"

Thanks for pointing it out!

Photoline is a 200 USD image editing package. DirecT60 is a 68060 based Atari TT clone running TOS3.06.

All the best,
Chris

>   pretty effecient with its system resources and does not require tons
>   of RAM/CPU speed/hard drive space, etc,...unlike Macs and PC's.. :)

The Amiga barely exists. The only Amiga model that rarely exist is the $2800

040 A4000T which has even worst price/performance than the Hades.. Only a handful of the A4000T have been sold not enough to exist as viable. Considering this is a 1992 design and were almost to '97'.. Again, the Amiga doesn't have the near functionality as a PC/Mac does today..

Just a Pentium 90? Running what OS? You can't even buy a Pentium 90 today, okay if you look hard enough in the Computer Shopper. The Pentium 133 is the bare minimum today. Know what they cost today? Much less than $2500 Hades with out monitor and CD!

> Oh, BTW, I think that running "real, equal apps" such as Calumus SL,

What are you babbling about? Has any $2800 040 Amiga 4000T been sold this year
in NA?

> But we don't HAVE to add that 16 meg simm you had to add to just get
> functionality and that is the point I am making. Good try, but alas ...

Yes you do when you use the Video Toaster and LightWave...
Lets see I paid $88 for a 16 meg sim and now have 24 megs ram..Just right..I

still paid far less than - just above 1/3 the price of the $2800 040 A4000T!

> Oh, please ... my 3000 runs high-res laced and so do most of the others out

> miss anything you have Pete!

In 4 color mode..Must be enough to view the pages in glorifying color.
IBrowse, Aweb, Alynx, AmFTP costs extra, only Amiga! I don't know about you,
but Netscape is continously updated by the sweat of the programmers as well and
is packaded in all Mac boxes part of the Internet Connection kit.. Amiga users
pay more for less, only Amiga!

> If it wasn't proprietary, I'd be happy to send you a listing of Team Amiga

> have gained nothing by osmosis ... though we all here keep hoping.

What breed is this? If you want to live in the past, your choice, only Amiga..

> Oh, I definitely would. The Amiga is what spurred on the likes of M$ and Apple
> to get where they are today. Damn shame it took them 10 years to just catch up
> to my old, dying, derilect of a computer ... an Amiga 3000/25.

ROFLMAO!! The Amiga 3000 was passed years ago.. Not speaking for MS, Apple has
great tech in the software area like Cyberdog and QTVR...Nothing like that on
the Amiga, only Amiga!

Yep, that video card adds cost to the overpriced Amiga today, only Amiga.

> chipset than the 060, no doubt about that. The MacOS and software slows it down though. This is the real issue here.

The Mac OS does more costs less than a TOS 060...Try running Cyberdog and
Quicktime VR on TOS 060...

Heck, ClaisWorks loads up faster than Word but has less features to speak of.
Now you compare a PhotoShop lite clone to the real thing is pathetic.. Next
time try eqevelant apps next time.

Comparing feature to feature and functionality to functionality is the issue.
Photoline is not equivalent to Photoshop...

> And you saw photoline when and where?

Stated before, photoline is not equivalent to Photoshop on a feature to
feature.. Like me saying that ClarisWorks is equivalent to MS Office..

> Yeah that would obviosly be the most likely explanation, you (the one
> with neither machine) would know better than the person with both.

You made the claim..Do you own both machine?

> Sounds like you can't take defeat.

Take what defeat?

> If you meant to type 'then', then it's hardly a fair comparison, is
> it? Ho much was a 9500 back then?

Today, a 132 mhz 604 box is $1899, much less than the Hades..

A PowerTower 166 is around $2500..You're money..(TM Bob Dole)...

> Yeah he made claims and you haven't seen the machine and keep

> Oh! I see, so if we also used the press release from way back when the 9500 came
out at
> close to 7500.00 that would be a fair comparison then?

Interesting...I thought the 9500 was around $5000 when first released.. $5000
buys the fastest 225 mhz PowerMac.. An equivelant to the 9500/132(no longer
made) costs $1899..

>>Why? You made claims..
>
> You said you wanted me to send you one. pay me for it and I will send it. Or are
you
> just being you?

Why would I buy an antique?

Can you buy a 90Mhz Pentium today? The baseline one is 133mhz. Who cares if your Falcon boots a WP that is not up to snuff to the others on the other platforms.

Okay...How about easier than any Mac wp?

That will do when using ancient apps...Thats how it feels on mine too..

I think the latest version of Calamus SL was just released some weaks ago. Cubase
Audio was also upgraded a month or so ago and CAB is also becomming much
better for each release. Apex Media is a very good realtime graphicsprogram for
the Falcon030/040 and a new version which is completely rewritten is out later
this
year. There is also Apex Audio on it's way later this year which will be awesome.
There is also talk about Apex FFT for _very_ advanced soundprocessing for
professional use. :-))

I started in 1984. The term didn't even exist vis-a-vis computers until Mickey$lop finally managed to get us at Intel to make a CPU fast enough to keep up with the bloated code coming out of Redmond, but combined graphics and sound have been available and used on Atari/TOS systems since shortly after the release of the 520ST. One of my favorites is a movie (the name of which escapes me at the moment) starring Ralph Mariano's cat (doing evil, cat-like things to the dog); another really good one is Spider Patrol. Both of those are over ten years old. I hooked to video output of my ST to a VCR a couple years ago and recorded a demo tape for the local Fidonet sysops; these guys were all running the hottest available PCs at that time, and to a man, they were favorably impressed with the multimedia capabilities of my system. It was about nine years old at that time. The Falcon and new TOS clones are far more powerful and faster, easily capable of much better performance using the exact same software, or of stunning feats using modern applications. It was just 4 years ago that I saw the "Tina Turner" movie running on a Falcon. There wasn't a Mac or PC system that could touch it at that time; the DEC Alpha was about equal as long as the performance was silent, but fell down when sound was added.

The Mac is a good system. However, it's NOT the topic of this newsgroup. Please try to remember that, lest you suffer the warth of the net.gods once more.

You are no position to tell anyone whether or not those apps are not equivalent. The only reason we might know that there is any difference at all is because of the forthcoming nature of the tester. You are completely ignorant on these matters.

It also appears to be more than 3 times faster. In the end, this makes it a better deal.

Well, Peter, up to your old tricks, I see.

You keep going on about this "Cyberdog;" what the heck is it? I have a lab here with every sort of Intle machine ranging from a 486/33 to multi-proc P/200 servers, and out of more than 200 engineers within spitting distance, not a single one of them even knows what "Cyberdog" is. If it's so great, how come Mickey$lop hasn't stolen it for the PC yet?

>with Photoshop?  OpenDoc is used with Cyberdog which you do not understand..

    OpenDoc and OLE are both software component specifications.
    They aren't limited to your precious little Cyberdog. You have yet to
     address what the value of a megolithic application built from 'parts'
     gives you that a bunch of 'parts' as standalone applications will not.
     Both are primarily for dealing with the consequences of trying to build
     apps that attempt to do everything and still have to be loaded into a
     'real' limited resource machine.

>
>Calamus SL, does it exist?

Quite obviously yes.

>CAB, just shareware?

Just because in the PC/Mac world a shareware program that just prints "My name is Pete" on the screen will cost you $102.56 doen't mean that it aplies in the Atari world. It's a fine program and it's not really shareware anyway, it's freeware with donations if you want to and it's certainly not the typical share/crippleware.

>Cubase Audio, from what I
>heard is no longer being updated.

So what? I know you aren't used to good quality programs with few/no bugs in them but it doesn't mean they don't exist. You are so typical in your update mentality, i'm sure you upgrade your programs when you know you won't ever use any of the extra features.

>Apex Media, whats that?

Your ignorance is more astounding than ever.

The Toad thread is taking quite some time as Pete answers questions
with stupid "your machine must be broken" answers that often even have
nothing to do with the questions asked. Due to the nature of Usnet it
means that it takes weeks to get an ounce of sense and so I propose
that maybe we take the debate ot IRC and whizz through it there, I'd
certainly love to. A time acceptable to both US & UK citizens would be
nice, possibly Sunday (this or next week)? If anyone is interested
then post to this thread and if some people are interested and Pete
can handle it then we can sort out a time.
I look forward to hearing from you all.

>> have intermittent windscreen wipers and 5 seats.
>
>Comparing feature to feature and functionality to functionality is the issue.

Exactly, the feature we are currently comparing is the ability to load
a TIFF, the Apple machine isn't as fast.

>Photoline is not equivalent to Photoshop...
>
>> And you saw photoline when and where?
>
>Stated before, photoline is not equivalent to Photoshop on a feature to
>feature.. Like me saying that ClarisWorks is equivalent to MS Office..

That was not the question, it's still there, read it slowly, get
someone to read it to you if you have to and reply. It's easy!

>> Yeah that would obviosly be the most likely explanation, you (the one
>> with neither machine) would know better than the person with both.
>
>You made the claim..Do you own both machine?

I don't recall any claim, just you 'debating' someone elses results
when you have no way of knowing the truth or at least no will. If you
saw it I'm sure you'd swear it was actually an apple in a different
case.

>> Sounds like you can't take defeat.
>
>Take what defeat?

The one here the 9500 wasn't as fast, you've just proved you can't
take it by pretending you don;t know what I'm talking about.

>> If you meant to type 'then', then it's hardly a fair comparison, is
>> it? Ho much was a 9500 back then?
>
>Today, a 132 mhz 604 box is $1899, much less than the Hades..

Less speed for less money, sounds fair.

>A PowerTower 166 is around $2500..You're money..(TM Bob Dole)...

I'm afraid that I am not actually money.

>> Yeah he made claims and you haven't seen the machine and keep
>> disputing the claims, there's no way you'd buy a machine because you
>> couldn't admit being wrong. Would you send me a 9500 is I said my ST
>> was more powerful than it?
>
>I don't have a 9500 at home but 7600/132's at work..

I know that but that had little to do with the point of the question.

Afford doesn't directly mean anything to do with money Pete, that was not what I was talking about. I see you still haven't upgraded your 'net software to the version with the the cut button. When you get it, highlight the signatures on your replies and press it.

Introducing the MPOWER line of Mac OS compatible personal
When we asked our customers what they wanted in an Apple Macintosh compatible clone computer, we weren't surprised to hear that most of them wanted two things: great performance at a great price, and the ability to order the system they want, with the drives, and other options they need, but without a bunch of "features" they neither need nor want. The APS MPower series of personal computers is designed to accommodate both of these requests. Priced hundreds of dollars less than systems with similar performance and features, APS MPower systems deliver the exceptional performance of Motorola's 603e and 604e PowerPC processors. APS MPower systems offer a staggering array of storage and peripheral options - and why not. APS Technologies is the premier supplier of storage and backup products to the Macintosh market. Our "Build Your Own Box" option lets you configure your own system with an astounding amount of flexibility.

The Best Engineering - Motorola

When we asked our customers what they wanted in an Apple Macintosh

* Motorola - manufacturer of the PowerPC processor &endash; no one knows it better
* MPower takes advantage of Motorola's quality processor technology, innovation & reliability

The Best Service and Support

* MPower comes from the company you've known and trusted for years
* MPower has the backing of APS' award-winning service and support

Exceptional Value

* Best mix of advanced processor technology and high-quality

Whenhardwared our customers what they wanted in an Apple Macintosh
* Compared with other personal computers running Mac OS, APS' MPower gives you the most for your money

Most Configuration Options

* APS, the recognized leader in Mac data storage solutions, has the hardware that you want included with your next Mac OS system - hard drives, removable media devices, and tape backup systems

APS MPOWER 603E160 $1399

Wh* The best value in PowerPC computing!nted in an Apple Macintosh
* 160MHz Motorola PowerPC 603e processor
* 16MB of RAM
* Three available PCI slots and two available 3.5" drive bays
* 1.2GB hard drive

5

* 8X CD-ROM

* Monitor sold seperately

The new benchmark in PowerPC, Mac OS computing, the APS MPower 603e160, for under $1,400, is the value leader in RISC-based workstations. The perfect home, or mass application PowerPC computer includes a 1.2GB hard disk drive, an 8X CD-ROM, and 16MB (upgradable to 160MB) of RAM. The APS MPower 603e160 includes a mouse, ADBtosh keyboard, three PCI expansion slots, and two available 3.5" drive bays. One-year limited warranty.

APS MPOWER 603E200 $1599
* The ideal mix of performance and value
* 200MHz Motorola PowerPC 603e processor
* 16MB of RAM
* Three available PCI slots and two available 3.5" drive bays
* 1.2GB hard drive
* 8X CD-ROM

* Monitor sold seperately

7

Outstanding performance at a terrific price, the APS MPower 603e200 is the bang-for-the-buck system of choice for individual and institutional users alike. Powered by Motorola's 200MHz PowerPC 603e processor, the APS MPower 603e200 comes ready for action with a 1.2GB hard drive and an 8X CD-ROM. Run most applications in the installed 16MB of system RAM (upgradable to 160MB) and enjoy the exceptional performance afforded by the 256KB of Level 2 cache and 1MB of VRAM. Three PCI slots and two available 3.5" drive bays let you add a whole range of PCI card and peripheral options. With the included mouse and extended ADB keyboard, this is the value-priced performance system of choice. One-year limited warranty.

APS MPOWER 604E200 $2599

* High-performance mini-tower PowerPC system at an exceptional price
* Blazing fast 200MHz PowerPC 604e processor
* Five PCI slots and four available drive bays

* 2.5GB hard drive
* 8X CD-ROM
* 24MB of RAM

* Monitor sold seperately

Blinding speed and exceptional value set this high-performance PowerPC, Mac OS workstation firmly at the top of the heap. The APS MPower 604e200 comes equipped with a gigantic 2.5GB hard disk drive, an 8X CD-ROM drive, and 24MB of RAM (upgradable to 160MB of EDO DIMM RAM) - and that's just for starters! Turbocharged with 2MB of VRAM and 512K of Level 2 cache, the APS MPower 604e200 includes five PCI slots for video, networking, peripheral expansion, and other PCI-based cards. The roomy mini-tower design includes four available drive bays for optimal customization of the high-performance MPower 604e200. One-year limited warranty.

Just give MS some time...They did not know what a web browser was until recently..

Apple's Cyberdog 1.0 Ships

First Integrated Internet Suite Offers Tight Integration Across Internet Applications and Mac OS

WWDC, SAN JOSE, California--May 13, 1996--Apple Computer, Inc. today announced shipment of Cyberdog 1.0, an integrated software suite that provides easy and intuitive access to Internet resources. Cyberdog was released to thousands of developers at Apple's Worldwide Developer Conference. A consumer-oriented version of the product, including broad distribution, is planned for later this year.

The advantage to Cyberdog is that it offers the first Internet suite of products with a common look and feel, offering easy drag-and-drop control across different Internet services, as well as tight integration with the Mac OS and Macintosh OpenDoc-compliant applications. The result is that Cyberdog's browser, mail reader, Internet address notebook and news reading components are completely integrated with one common interface to accomplish Internet tasks. Cyberdog's integration with the Mac OS and Macintosh applications embeds Internet resources throughout the user's work, making Internet connectivity an extension of the desktop. For example, a user can drag and drop a live URL to the desktop, driving Internet links from the operating system rather than a browser.

"Internet access has been dominated by the application browser," said Larry Tesler, vice president of Internet platforms, Apple Computer

Inc. "What Cyberdog offers is a new level of integration by putting Internet access directly into the Mac OS and Mac applications. Instead of putting everything into the browser, Cyberdog puts the Internet into everything."

OpenDoc: The Technology That Brings Web Information Alive

Cyberdog is based on advanced technology called OpenDoc that lets disparate software modules work together as a seamless application. OpenDoc is an open standard that is available to third-party developers to instantly make their applications interoperable with other OpenDoc applications, as well as Internet-enable them with a link to Cyberdog. The benefit of OpenDoc to end users is that it gives them the freedom to replace one of Cyberdog's components with one offered by a third-party.

Cyberdog: Tools for Managing Internet Use

Cyberdog also provides DocBuilder, an OpenDoc application that supports inclusion of Cyberdog components, along with text and graphics. With Cyberdog's DocBuilder, and the availability of future OpenDoc-enabled word processing packages, users can create intelligent documents that combine text, graphics, data and information from the Internet. A single document can contain previously disconnected combinations of sound, real-time Web site links, graphics, text and pointers to relevant newsgroups. This document can be shared among Cyberdog users as "live" text which can be used to directly access the 'Net. These documents are a powerful communications tool because they easily organize and distribute Internet information and resources. A corporate Internet support organization could use these documents, for example, to easily direct end users to those Internet resources they considered valuable.

Cyberdog: Superior Mail and News-Reading Features

In addition to browsers for Web, Gopher, and FTP; telnet, notebooks for storing Internet addresses, and a log for tracking sites visited, Cyberdog offers superior mail and news-reading capabilities. For example, Cyberdog can manage multiple email addresses, allowing users to easily manage incoming mail from various mailboxes. Mail handlers can identify prioritized and unwanted mail, and categorize it for the user. A sophisticated search mechanism helps find emails by content, and can also archive Internet News Group Information. In addition, the message editor for mail and newsgroups supports full-styled text, including graphics, and "CyberItems." CyberItems are icons that represent links to Internet resources that can be easily clicked on to open and display resources, including Web sites, newsgroups, telnet sessions or files.

Third-Party Developers Offer Cyberdog-Friendly Applications

Numerous developers are already actively developing or enhancing applications to work with Cyberdog. Making an application "dog savvy" is as easy as supporting OpenDoc, and instantly makes applications Internet-ready.

For example, Macintosh word processing software vendors such as Claris, WorldSoft and Digital Harbor are supporting Cyberdog to enable their applications to develop "live" documents that link to Internet resources.

In addition to Cyberdog-enabled "live" documents, developers are offering a host of capabilities to Cyberdog users. Addison Wesley is developing interactive CD-ROM titles that use Cyberdog to retrieve content from the Internet; Corda Technologies offers a graphing component that uses Cyberdog to graph information directly to web pages; and OnBase Technology is offering users an alternative to the standard Cyberdog notebook.

For developers, third-party suppliers are offering several tools to promote OpenDoc and Cyberdog add-ons. Spyglass is offering a Web Technology Kit (WTK) that offers components for making applications, services or devices web-wise. The Spyglass WTK supports Cyberdog as well as HTML browsers, giving users the option to plug in their preferred browser. ResNova software has announced the development of a Java applet viewer for Cyberdog called "CyberJava." This component enables the user to play Java applets within any OpenDoc document, not just Cyberdog components. Kantara Development is offering developers "PartMerchant," an online source for buying and selling OpenDoc components that are based on Cyberdog.

Price and Availability
Cyberdog will be distributed free of charge on the Apple Web site (http://cyberdog.apple.com/). The Golden Master version is available today, with broader distribution planned for later in the year.

     You also need quite a bit more Mac (of any kind) just to load
     the OS. It brings up those nasty little issues you always
     refuse to address: real thruput & real power.

     Atari's can be quite usable running only in the resources that
     Macs (or PC's) waste.

Actually, I am very pleasantly surprised.  This, combined with the SunApple
alliance (to counter NT server) is giving Apple a fighting chance it lacked
just two months ago.

Yep...Still a pentium system... Why not advertise the ST clones?

So what you are stating is that a PPC 603e 160 mhz is not as good as a 16 mhz
68030? So what are the other indicators? Considering the price includes a 28k
modem and at least 1.2 gigs....

Whats a quite bit more Mac are you referring to? So what you are stating is that a $1600 160 mhz Powermac is not capable or enough for the entry level users? Considering that it includes a 28k modem? Considering that this pup blows away the $3000+ Hades....

> Atari's can be quite usable running only in the resources that
> Macs (or PC's) waste.

Interesting.. The apps that came with my lowend PowerMac runs great.. 1980's ST and 1980's ST apps still run...If progress is not a concern thats okay...However you are out of luck with 1996 APPS such as web browsers and lots of CD multimedia apps.

     The modem is rather peripheral.
     Considering that Apple and Microsoft do their best to squander whatever
     computing resources are available, it would not be at all surprising if
     that 'entry level' machine won't keep up (or wont keep up 6 months from
     now).

>blows away the $3000+ Hades....
```

GEM doesn't need that much machine. MacOS does.

...just how much time do you spend running multimedia toys?

Browsers, even beyond CAB, can be had for those with the interest.

Progress in one area does not indicate progress in any other. In fact,
regression could occur in all others and your 'media hype marketing'
philosophy would not notice it. Regression in the others can nullify
what apparent progress has been made.

I'd love to see Apple release System and Finder for the PC - if it can maintain
the ability to use DOS 8.3 filenames, and read Win95 long filenames, it HAS to
be better than M$ crap. A little competition would be healthy in the PC OS
market, and only Apple is in a position to do any such thing.

Congratulations! You are the recipient of a new Organ, donated by PETER SINCLAIR-DAY-PISS-POT-BOIL-YOUR-BOTTOM who kindly wishes you to have a bit of their body.

This spanking new service is provided entirely free of charge by The Spam Club.

Should you wish to avail yourself of this modern Internet service dial http://www.PythOnline.com and join the Spam Club.

Warning: if you are of a nervous disposition or just plain stupid, you should be advised that this is A. Joke (under the strictly legal definition of A.Joke. See California Penal Code Number oh I can�t be bothered to look the frigging thing up.)

Anyway, here is the joke ...
I PETER SINCLAIR-DAY-PISS-POT-BOIL-YOUR-BOTTOM being of sound mind (or liver) hereby donate the bits that never get washed to JEDI. I am availing myself of the new Spam Club service of e-mailing unwanted bits of my body to various friends, relatives, acquaintances, and complete strangers. Because, I liked the look of you in the moonlight from behind

STILL a Pentium system that they provide as an alternate platform to
run TOS software! (think about it!) Oh, boy, where have you been
hiding? They DO advertise the TOS Clones-they have even been appointed
as the official Hades source here in the states...!

Sorry, 1996 APPS such as CAB and various TOS based multimedia APPS work
just fine on my 1987 Mega and are outstanding on my 1993 Falcon... :)

Oh, BTW, I know what the MIPS rating for an '060 Hades is; but I don't know what it is for the 160mhz Apple you were referring too...Can you please be so kind as to enlighten us? Thanks...(but still keep in mind that it takes a lot less "grunt" to effectively power the Atari (TOS) environment as compared to other platforms--yes, even system 7.xx) :)

[sigh] You'll get them every time. Why they do it, is beyond me, when many of these cancels have no rhyme or reason, just random. I recognized a part of the Path header as coming from a bot called Dave The Resurrector, run by Chris Lewis in the news.admin.net-abuse.misc newsgroup. He's not the canceller, rather, he and his bot is the one that reposted those that were cancelled. Who the canceller was, I don't know. You'll have to ask him.

newsgroups: comp.sys.atari.advocacy,comp.sys.atari.st,comp.sys.atari.st.tech

For those of you who follow such things:

A formal propoasl to establish (or reestablish) comp.binaries.atari has been submitted to the appropriate net.gods - it has been over 3 weeks since submission, in fact, but the RFD has not yet appeared in news.groups nor in news.announce.newgroups (the "official" venues for such discussions).

It is suspected, based on comments made in those groups, that there is deliberate foot-dragging going on vis-a-vis any RFD to establish any binaries newsgroup.

Anyone interested in participating in the newsgroup creation process is invited to subscribe to news.groups (but I'd suggest you have your killfile ready - there are any number of totally irrelevant postings in there most of the time).

Seems that Microsoft can get any number of newsgroups made in the comp and
binary areas! I had to tell TIN I didn't want to subscribe to a whole lot
of them, took a while to get thru!

The Hades is not that much more expensive here. I won't buy one, though,
for a clone PC comes much cheaper than both Hades and PowerMac.

Hi,

I need very very QUICK help for an Ethernet card called RIBEL C90.
                 =====
```

There is on it Jumpers :

J1 to J6 next to the BNC connector
J11 alone
J8 to J10 next to the VME port
J17 to J23 next to the memory

I want to make it running on TT030 ...

For the moment I have the driver for Ribel + !?
It always said that it don't find the card ...

So have you got a driver for it ?
Could you give me more informations about the jumpers because I have
no documentation of it !!

Please reply by Email ... !!

Thanks per advance for your help !!

With Best regards,
Herve

The modem adds value.. My 75mhz PowerMac keeps up nicely for what I use it
for. Considering this model first appeared in '95'.... You assume to much
Jabba. There always will be something faster and cheaper in six months or
sooner. It's called progress but ST users do not have that choice..
>>blows away the $3000+ Hades....

You mean multimedia tools.. Multimedia tech is becomming more integrated in
the apps that you run today like the plugin tools for netscape and so on.
Becomes transparent to the user..

>   Browsers, even beyond CAB, can be had for those with the interest

Try running a quicktime video and real audio with CAB...

The answer's easy...Billionare Bill can get any newsgroup he wants on the Net including one with GIF pictures of his wedding photo. Meanwhile, the people(those who actually work for a living and buy and use products) are basicallly told to go stick it, especially on a non-Micro$lop platform which alone is basis for charge of heresy by the 'mainstream' computer industry.

Wow, you think a $200 ST with $50 modem and CAB can get even lower-class people access to information on the Internet. But I guess it's reserve to those at least middle-class who can afford the most recent expensive setup.

Sorry for the ranting, but I just read an interview of William Gibson who talked about the same thing. Since he coined the phrase "cyberspace", then he outta know a few things. :)

Thumbing his nose at Internet ellitism is the computer shock-jock...

How can that be? Last I checked you can't even get a 603e 240mhz AV
model as of yet.
I tried to place an order through work and was put on a waiting
list..........
These machines, in this configuration, simply were not available as of
yet.
Interesting to note that most Mac rags had them advertised however. Talk
about
Microsoft bullshit. Call me, maybe if your dumb enough you'll give me
your credit
card number to hold for a few months........
So are you saying that all of Europe will be forced to purchase a
machine that
cost over $3000.00 U.S. dollars? I think you may be missing a market.
One that
you fit into. If the 604e's are so bitchen running at 200mhz why didn't
you buy
one?
Don't bother to answer that, I think we all know the answer.

Mike

>So why are they hawking the cheap Pentium?

Because it is cheap?

>Could it be that the Hades is three times much for less performance..

Hades is more computer, it is faster at getting tasks done than Pentium Pro. We have run numerous tests and timed them, it boots, it loads, it performs functions faster than any desktop computer.

It is a jaw dropping experience. Especially when you consider that it is using "so called" ancient technology like a 68060.

All the best,
Chris

Interesting.. How about a real world test like equivelant software? Try
loading up PageMaker and see which one performs..

I am sure you were using the same software such as Office on both machines..

I'm trying to find the name of the person(s) who did the voices for
Atari's
Gauntlet I & II coin-op games. If anyone can put me in touch with
someone at
Atari who might have this information, or who might know someone that
does,
please email: eakes@uiuc.edu

Thank you much!

yep..You can't get a PowerBase 240. However, Power is supposely shipping down the que this week. The powerbase is backordered to December. Some $50 million accordingly. Power jumped the gun by announcing at MacWorld and not having the product to sell. However, the other clone makers will jump in the market with fast ones...

Why I did not buy a 604e box was due to financial reasons.. I found the $900 Powermac Performa would serve my needs for now than comming up with $2000 for a fast 604 box. In six months time the 604 box should be going for half the $2000 or a fast 603e box.

>sooner.  It's called progress but ST users do not have that choice..
it's called progress is it? Can computers now type faster than I can think?
It's not called progress it's called capitalism. it's making money from
people. selling them dreams and hype and an emotional connection to
reality, which some people need.
>GEM doesn't do much in features and functionality..
Wha...?!
GEM functions quite nicely.
example: a floppy disk icon is on my desktop, I want to open it, I double
click on it, it opens - WOW! awesome!
as for features I have a wide choice of features such as desktops: Gemini,
NeoDesk, Ease, etc. I have a choice of multitasking systems Geneva, MultiTOS,
MagiC, Linux(Falcon/TT only)
>Sure can running old software like Mac plus users can find their machines
>useful as a fish tank..
a feeble put down based on your perceived emotional reality. If software does
what I want it to do, I'm happy. If it doesn't I'm unhappy -
regardless of the system I am running OS/2, Mac, TOS, Windoze,
DOS, etc. The _age_ of software is irrelevant to the ability
of the software to help me to do what I want. The _age_ of the
software is only relevant to those people who make a living
programming software, and who would like to keep food on the
table,. The Atari market is one of the few where I have a
pretty good idea that my $ is going right to the programmer,
and not some slave lord like Bill Gates.
>You mean multimedia tools..  Multimedia tech is becomming more integrated in
>the apps that you run today like the plugin tools for netscape and so on.
>Becomes transparent to the user..
No. Not Multimedia tools. They are not "tools" they are games. they are toys,
they are shiny bits of glitz, they are 'selling features' they are
diversions and distractions from the business of living. They are
"amusements", they are fun.
>Try running a quicktime video and real audio with CAB...
yeh? why would I want to run a quicktime video, with or without audio?
>Typical Jabba nonesense...
It takes one to know one :^)

no, they dont mean 'a canceller which cancels messages by rogues'. ;)

Someone has maliciously been cancelling valid messages, and some sys.admin type as been automatically re-posting articles which should not have been cancelled. Unfortunately, some of us had read the cancelled messages before they were cancelled...

    So fucking what. It's a $100 component that can be had ANYWHERE if
    you use a standard serial interface (like everyone except apple).
    In this repect, even CompUSA still stocks walls full of Atari hardware.
    It adds TRIVIAL value.

>for.  Considering this model first appeared in '95'....  You assume to much
>Jabba.  There always will be something faster and cheaper in six months or
>sooner.  It's called progress but ST users do not have that choice..

   If that 75Mhz machine were so nifty then what really would be the
   utility in 160Mhz, 200Mhz or 240Mhz machines? They would just be
   a lot of wasted cpu cycles.

   Either the faster machines possess no real utility, or the older
   slower machine has now been made a dog.

   You really can't have it both ways.
```

Actually, MacOS doesn't really deliver anything more substantial
than GEM does. Sure it bundles quite a few application level
toys and tries to call them part of the OS but, that's something
else entirely.

It's a no frills GUI.
